Introduction

Dealflow is a business-development CRM for one company. It keeps your pipeline, deals, contacts, email, activities, quotes and invoices in one place, and it has built-in AI to summarise deals, draft emails and answer questions about your data.

This guide is for the people who use Dealflow every day: sales and business-development staff, and the admins who set it up. Each page is a set of short tasks with numbered steps, the result you should see, and tips.

Glossary

Term	Meaning
Activity	Something to do or something that happened: a call, meeting, task, deadline, email or lunch. Activities have a due date and can be marked done.
Admin	A user who can change company-wide settings. Admins have every permission.
Assistant	The AI chat panel. It can look things up in Dealflow and, after you confirm, make changes for you.
Base currency	The currency Dealflow converts every total into (for example GBP). Other currencies use the manual exchange rates an admin sets.
Board	The pipeline view with one column per stage and one card per deal.
Booking page	A public page where someone outside your company picks a time to meet you.
Deal	A potential sale you are working on. Every deal sits in one stage of one pipeline and has a value, an owner and usually a person and organization.
Follower	A user who gets notifications about a record without owning it.
Forecast	The view that groups open deals by the month they are expected to close.
Insights	Dealflow's reporting area: dashboards made of charts, and reports you build yourself.
Label	A coloured tag you add to deals, leads or contacts to group them.
Lead	An enquiry that is not yet a qualified deal. Leads live in the Leads list until you convert them to a deal or archive them.
Lost reason	Why a deal was lost. Admins keep the list of reasons.
Organization	A company you do business with. People can belong to an organization.
Owner	The user responsible for a record.
Permission set	A named group of permissions (for example Regular or Admin) given to users.
Person	A contact: someone you deal with.
Pipeline	A sequence of stages that deals move through, from first contact to won or lost. A company can have several pipelines.
Probability	How likely a deal in a stage is to close, as a percentage. It is used for weighted totals.
Quote / Invoice	Documents you build from a deal's products and send to a customer.
Rotting	A deal that has stayed in a stage longer than the stage allows. Rotting deals are highlighted on the board.
Stage	One step in a pipeline, such as Qualified or Proposal Made.

Term	Meaning
Visibility group	A group that controls which records its members can see.
Weighted value	A deal's value multiplied by its stage probability.
Won / **Lost**	The two ways a deal closes. Won and lost deals leave the board but can be reopened.

Getting started

This section covers signing in for the first time, finding your way around Dealflow, and the shortcuts that save time every day.

How to sign in for the first time

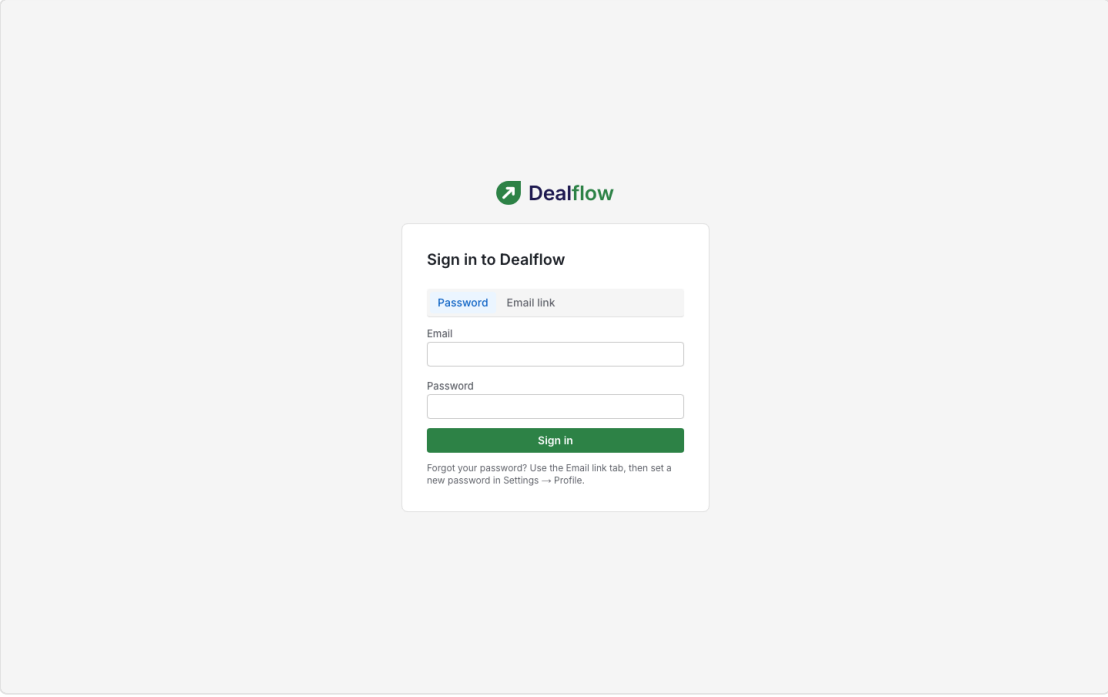

Your admin invites you by email.

1. Open the invite email from Dealflow and select the link in it.
2. Type a new password in **New password** and again in **Confirm password**.
3. Select **Set password and sign in**.

Result: you land on your pipeline board, signed in.

Tip: the invite link works once. If it has expired, ask your admin to invite you again from **Settings › Users**.

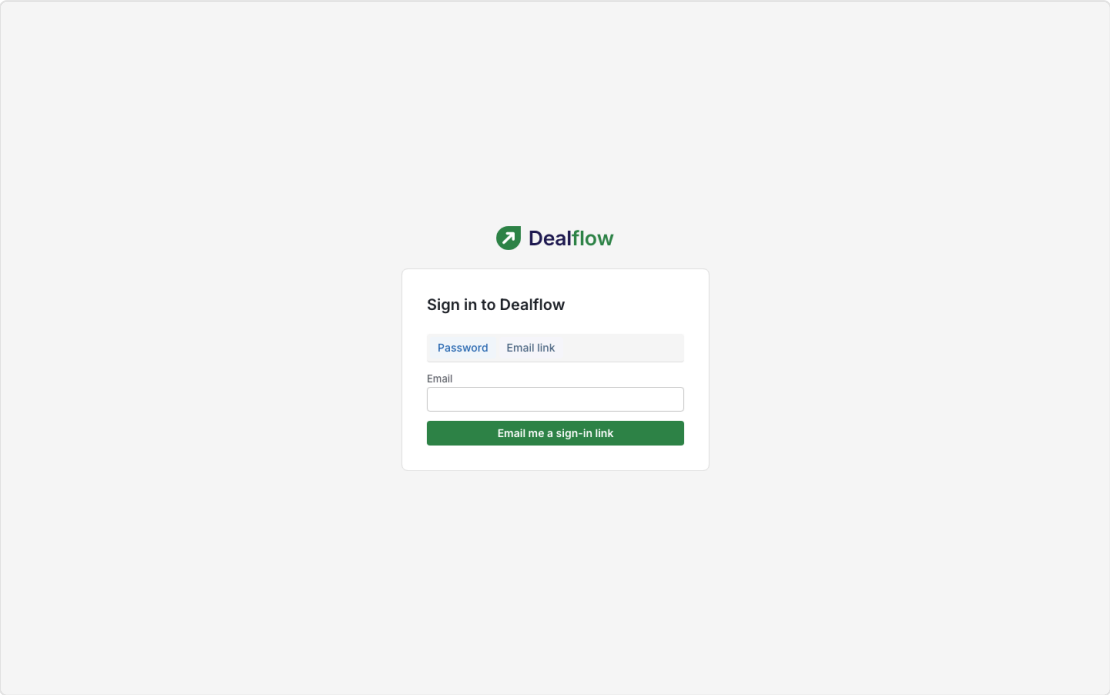

How to sign in with your password

1. Go to your Dealflow address (your admin will give it to you).
2. On the **Password** tab, type your **Email** and **Password**.
3. Select **Sign in**.

How to sign in with an email link

Use this if you would rather not type a password, or if you have forgotten it.

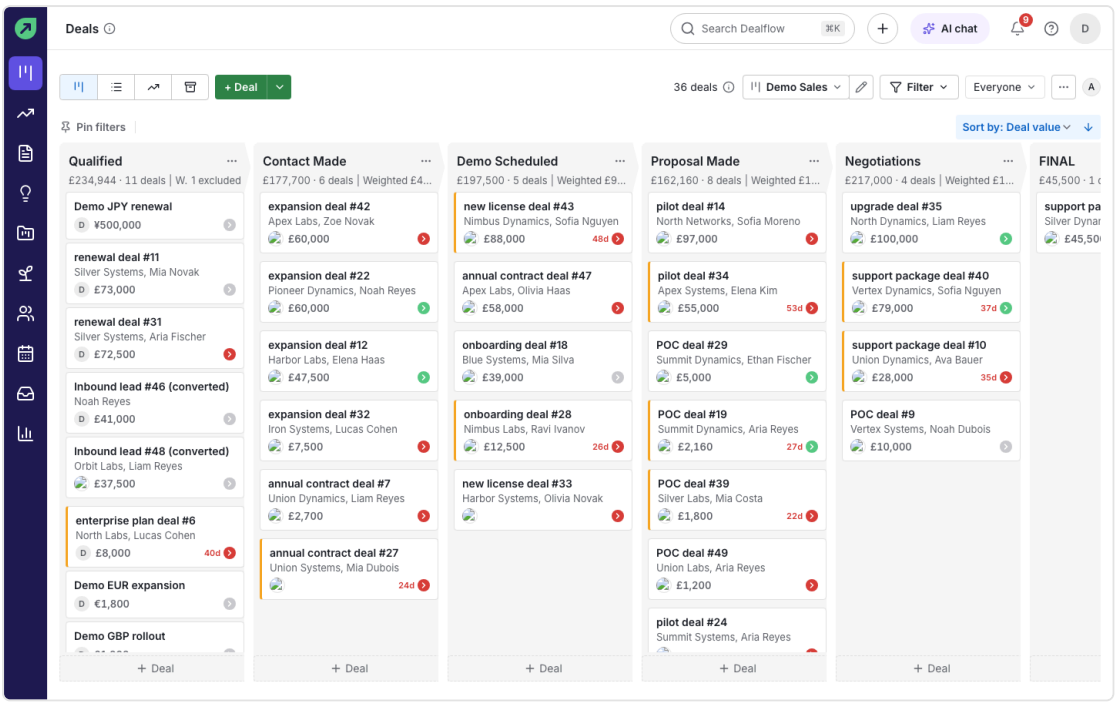

1. On the sign-in page, select the **Email link** tab.
2. Type your **Email** and select **Email me a sign-in link**.
3. Open the email from Dealflow and select the link.

Result: you are signed in. The page always says "If an account exists for that address, a sign-in link is on its way", whether or not the address has an account.

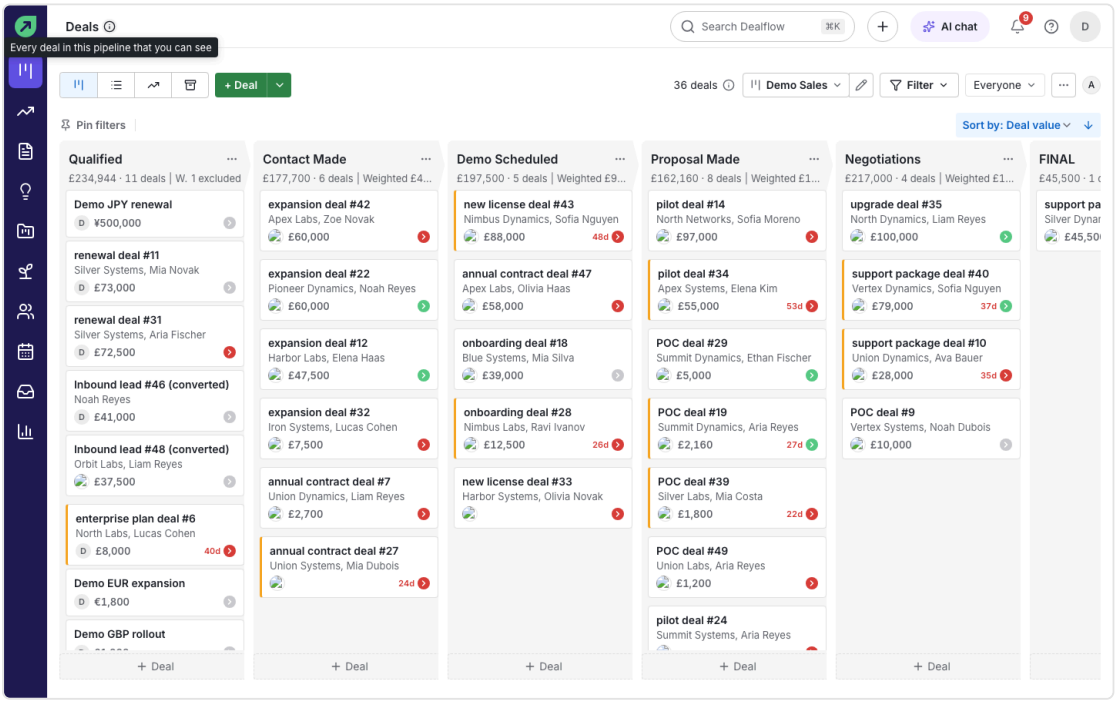

Tips:

- The link expires after 15 minutes and works once.
- Forgotten your password? Sign in with an email link, then set a new password in **Settings › Personal preferences**.

Finding your way around

- **Left rail.** The dark bar on the left takes you to Pipeline, Forecast, Documents, Insights, Projects, Leads, Contacts, Activities, Inbox and Performance. It opens with labels at 232 px wide. The leaf logo at the top takes you home.
- **Top bar.** From left to right: the page title (with an **(i)** button that explains the page), **Search**, **Quick add** (+), **AI chat**, **Notifications** (the bell), **Docs** (this guide) and your **Account menu**.
- **Settings.** Open the **Account menu** and choose **Settings**.

How to expand or collapse the left rail

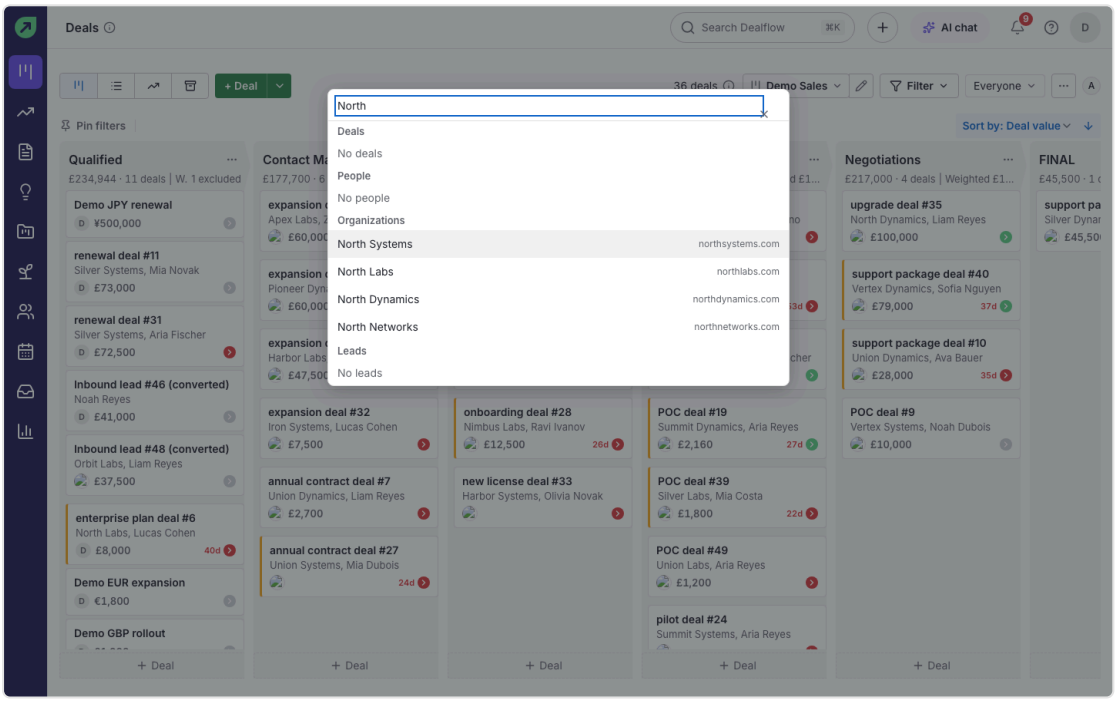

The rail opens at 232 px wide with every destination named. You can shrink it to icons when you want more room for the page.

1. Select **Collapse** at the bottom of the rail, or press `[`.
2. The rail becomes 56 px wide and shows icons only. Rest the pointer on an icon to see its name.

Result: Dealflow remembers the choice, so the rail opens the same way next time.

To bring the labels back, select the arrow at the bottom of the rail (its tooltip says **Expand sidebar**), or press `[` again. On a phone the rail becomes the bottom bar, so there is nothing to collapse.

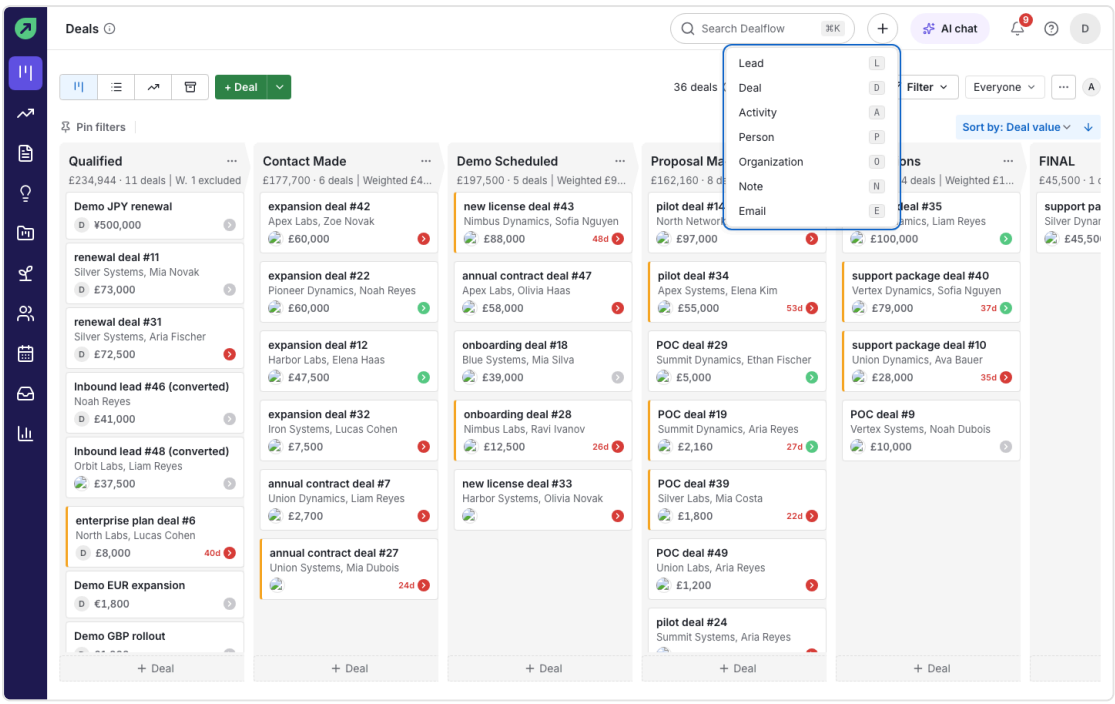

How to search for anything

1. Select **Search Dealflow** in the top bar.
2. Start typing a name, company or deal title.
3. Select a result to open it.

Result: results are grouped into Deals, People, Organizations and Leads as you type.

How to add a record quickly

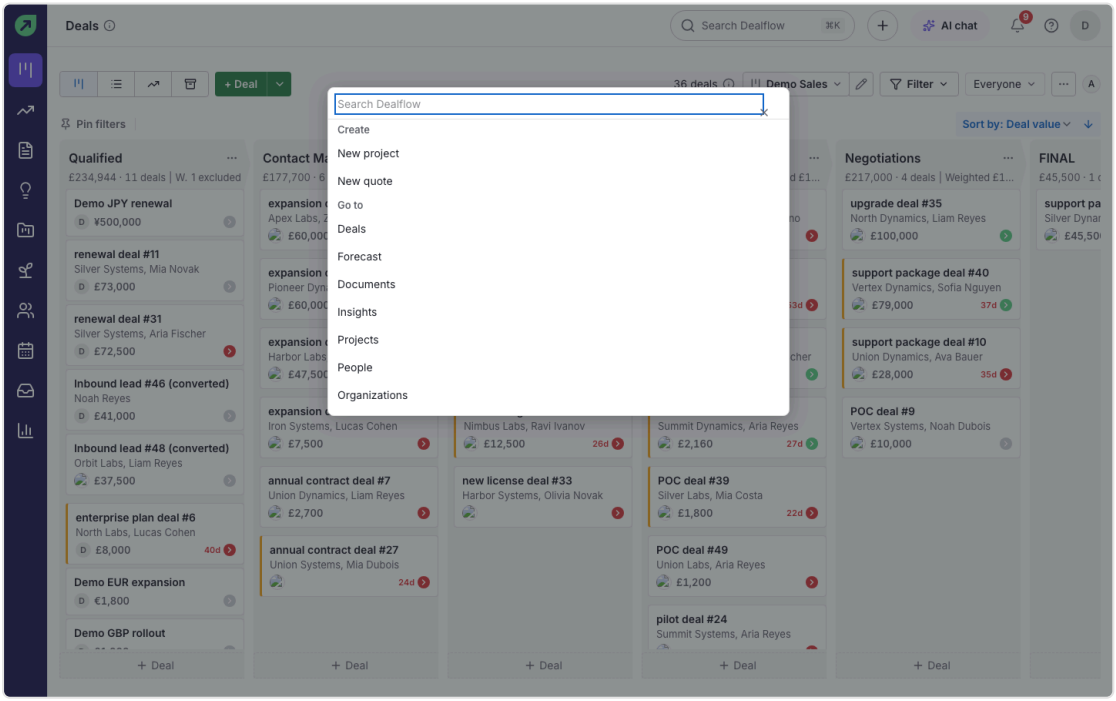

1. Select **+** (Quick add) in the top bar.
2. Choose **Lead**, **Deal**, **Activity**, **Person**, **Organization**, **Note** or **Email**.

Tip: with the menu open, press the letter shown next to each item (for example `D` for a deal).

How to use the command palette

The command palette lets you go anywhere or do common actions without the mouse.

1. Press `Cmd+K` on a Mac or `Ctrl+K` on Windows.
2. Type what you want, for example "forecast" or "new quote".

3. Press `Enter`.

Result: the palette lists **Create** actions (new project, new quote), **Go to** destinations (every main page and settings page) and **Actions** for the page you are on, such as **Mark won**, **Mark lost**, **Log call** and **Create quote** when you are on a deal.

Keyboard shortcuts

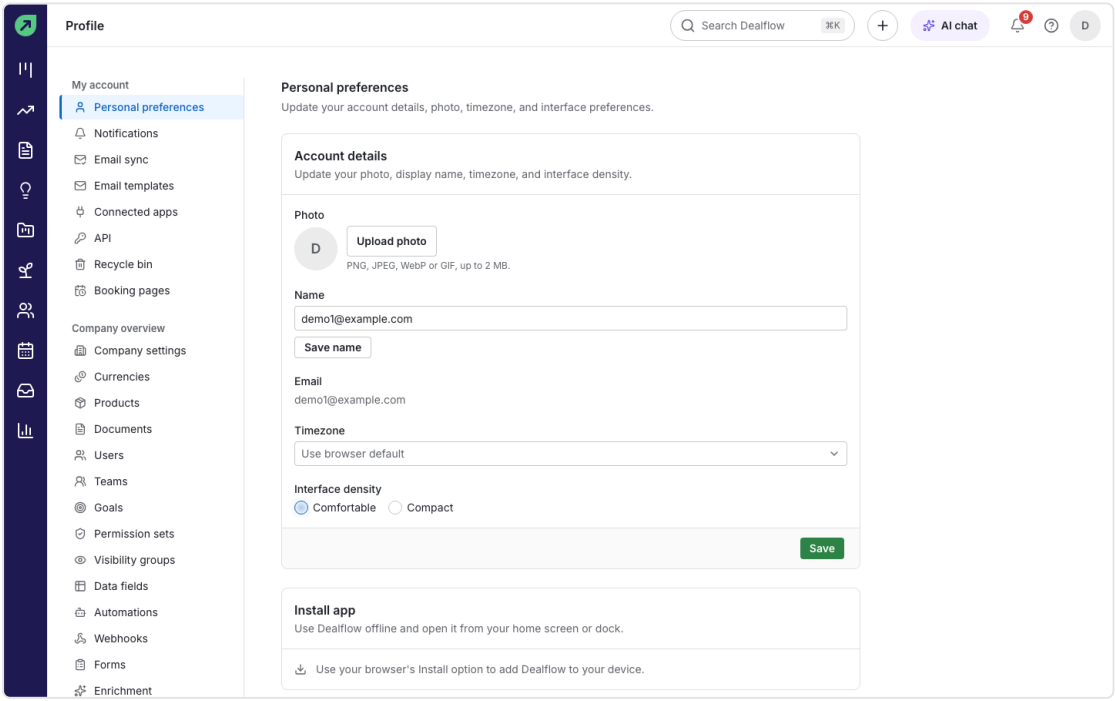

Press `?` anywhere outside a text box to open the shortcut sheet. The most useful ones:

Keys	What it does
`g` then `d`	Go to Deals (`p` People, `o` Organizations, `a` Activities, `l` Leads, `i` Insights, `j` Projects, `f` Forecast, `m` Inbox)
`n` then `d`	New deal (`p` person, `o` organization, `a` activity, `c` log a call)
`j` / `k`	Move up and down a list; `Enter` opens the row
`1` to `9`	Jump to a navigation item
`Cmd+K` / `Ctrl+K`	Open the command palette
`[`	Collapse or expand the left rail
`Escape`	Close a dialog or the palette

How to undo a change

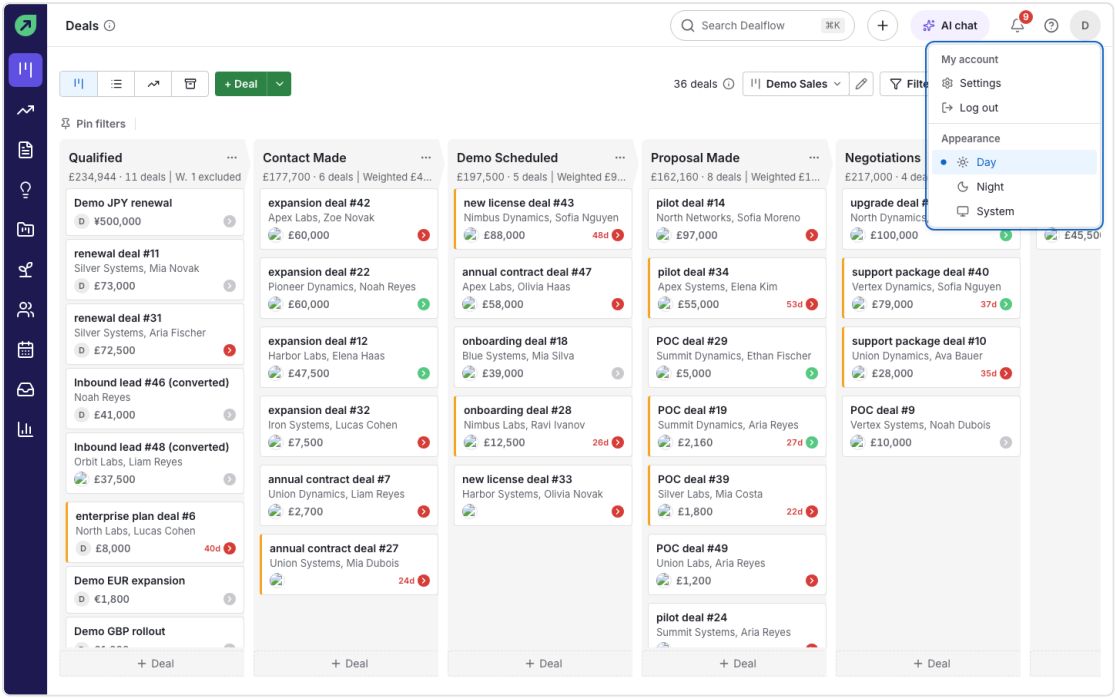

After many changes, such as moving a deal, Dealflow shows a message at the bottom of the screen with an **Undo** button. Select it within a few seconds to put things back.

How to update your profile and password

1. Open the **Account menu** and choose **Settings**. **Personal preferences** opens first.
2. Change your photo (**Upload photo**), **Name**, **Timezone** or **Interface density**, and select **Save**.
3. Further down, under **Password**, set a new password. Changing it signs you out on your other devices.

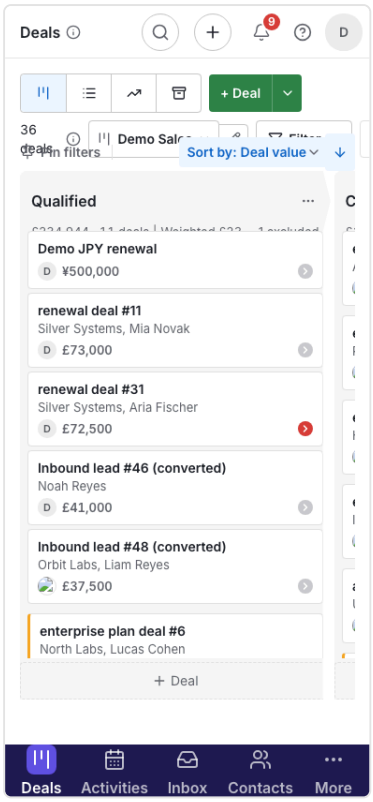

How to switch between light and dark mode

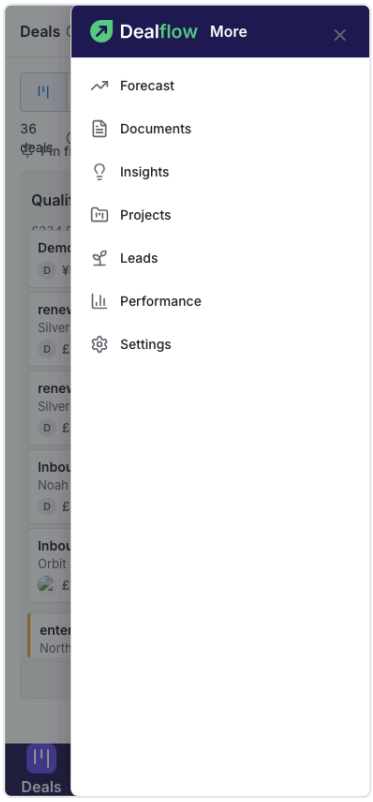

1. Open the **Account menu** (your initial, top right).
2. Under **Appearance**, choose **Day**, **Night** or **System**.

Using Dealflow on your phone

Dealflow works in your phone's browser.

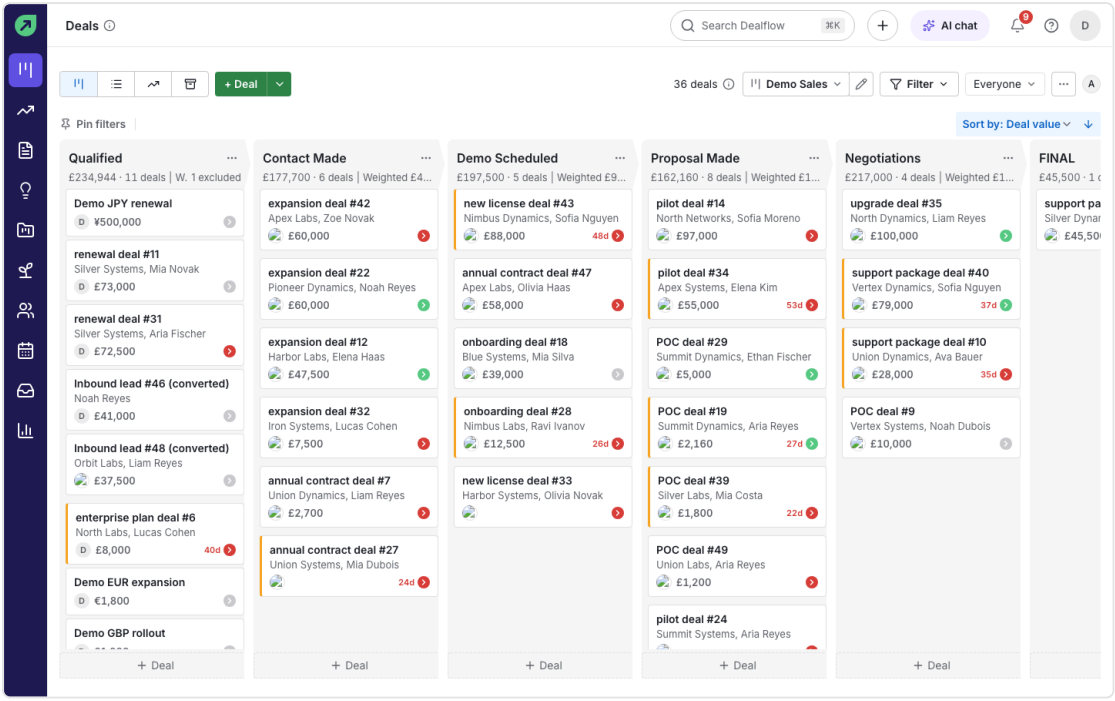

- On a phone the left rail becomes a bar along the bottom: **Deals**, **Activities**, **Inbox**, **Contacts** and **More**.
- **More** opens the rest of the app: Forecast, Documents, Insights, Projects, Leads, Performance and Settings.

Pipelines and deals

A **pipeline** is the path your deals follow, split into **stages**. The **board** shows one column per stage, with the total value, number of deals and weighted value at the top of each column.

How to read the board

- Each card shows the deal title, the organization and person, the value, and a coloured dot for the next activity: green when something is scheduled, grey when nothing is, red when it is overdue.
- A number like **40d** on a card means the deal is **rotting**: it has been in the stage longer than the stage allows.
- The toolbar switches between **Board view**, **List view**, the forecast and **Archived deals**, and holds **+ Deal**, the pipeline picker, **Filter**, the owner picker (**Everyone** or one person) and **Sort by**.

How to add a deal

1. On the board, select **+ Deal** (or press `n` then `d`).
2. Fill in **Title**, **Value** and currency, **Pipeline** and **Pipeline stage**. Add a **Contact person** or **Organization** if you have them.
3. Optionally set **Labels**, **Expected close date**, **Owner** and any company-specific fields.
4. Select **Save**.

Result: the new card appears at the bottom of its stage column.

Tip: fields marked with an asterisk are required by your company. Admins choose these in **Settings › Data fields**.

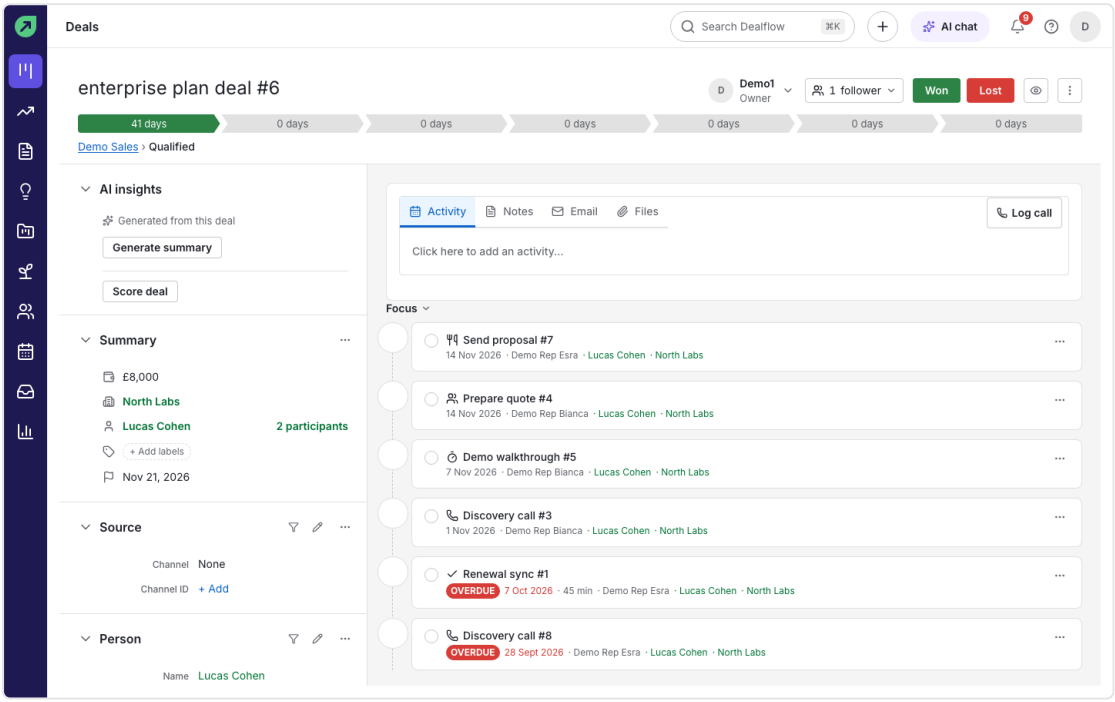

How to move a deal to another stage

1. On the board, drag the card to another column.
2. Let go.

Result: the card moves, the column totals update, and a message says "Moved to {stage}" with an **Undo** button.

How to open a deal

Select a card on the board, or a title in the list view.

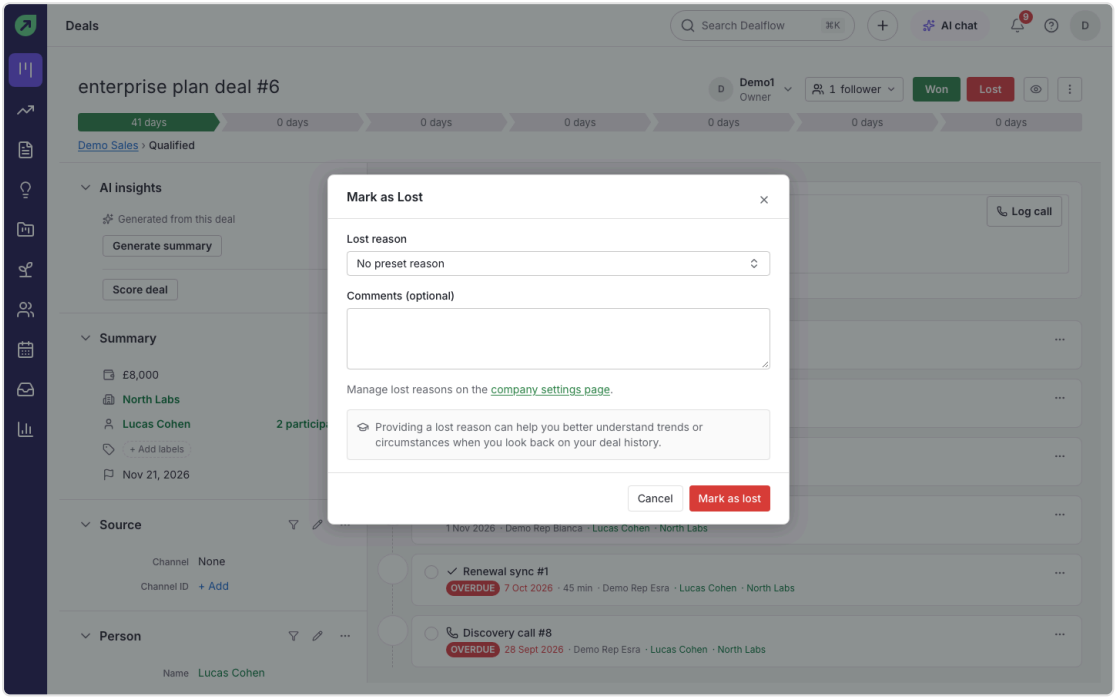

The deal workspace has:

- **The header:** title, owner, followers, **Won** and **Lost** buttons, and the stage track showing how long the deal has spent in each stage.
- **The left column: AI insights**, **Summary** (value, organization, person, participants, labels, expected close date), **Source**, **Person**, **Products**, **Documents**, **Projects** and any custom fields.
- **The right column:** tabs to add an **Activity**, **Notes**, **Email** or **Files**, the **Focus** list of what needs attention, and **History** (with All, Activities, Notes, Email, Files and Changelog).

How to mark a deal as won or lost

1. Open the deal.
2. Select **Won**, or select **Lost**.
3. For a lost deal, choose a **Lost reason**, add optional **Comments**, and select **Mark as lost**.

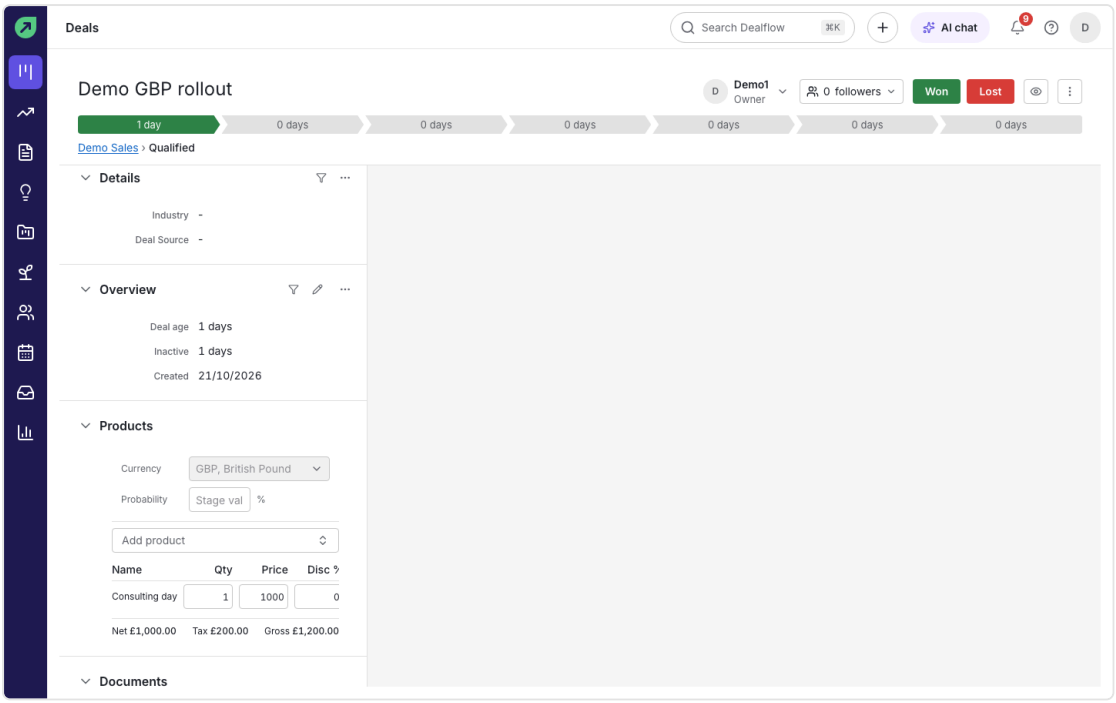

Result: the deal leaves the board and shows **Won** or **Lost** in its header.

Tips:

- To bring a deal back, open it and select **Reopen**.
- Admins edit the list of lost reasons in **Settings › Company settings › Lost reasons**.
- When you are on a deal, the command palette also offers **Mark won** and **Mark lost**.

How to add products to a deal

Products come from your company's catalogue (see Quotes and invoices).

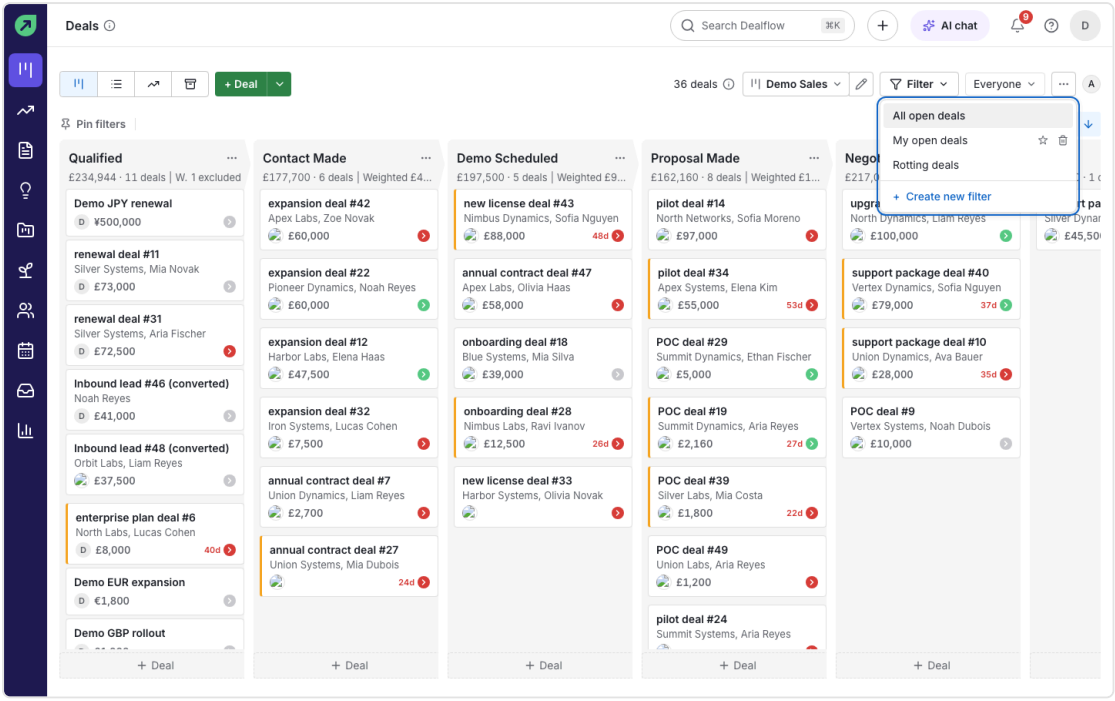

1. Open the deal and find the **Products** section.
2. Select **Add product** and choose a product.
3. Change **Qty**, **Price** or **Disc %** if needed.

Result: the deal value becomes "Calculated from products", and the section shows the net, tax and gross totals.

Tip: a deal has one currency. Values in other currencies are converted to your company's base currency in totals, using the rates in **Settings › Currencies**.

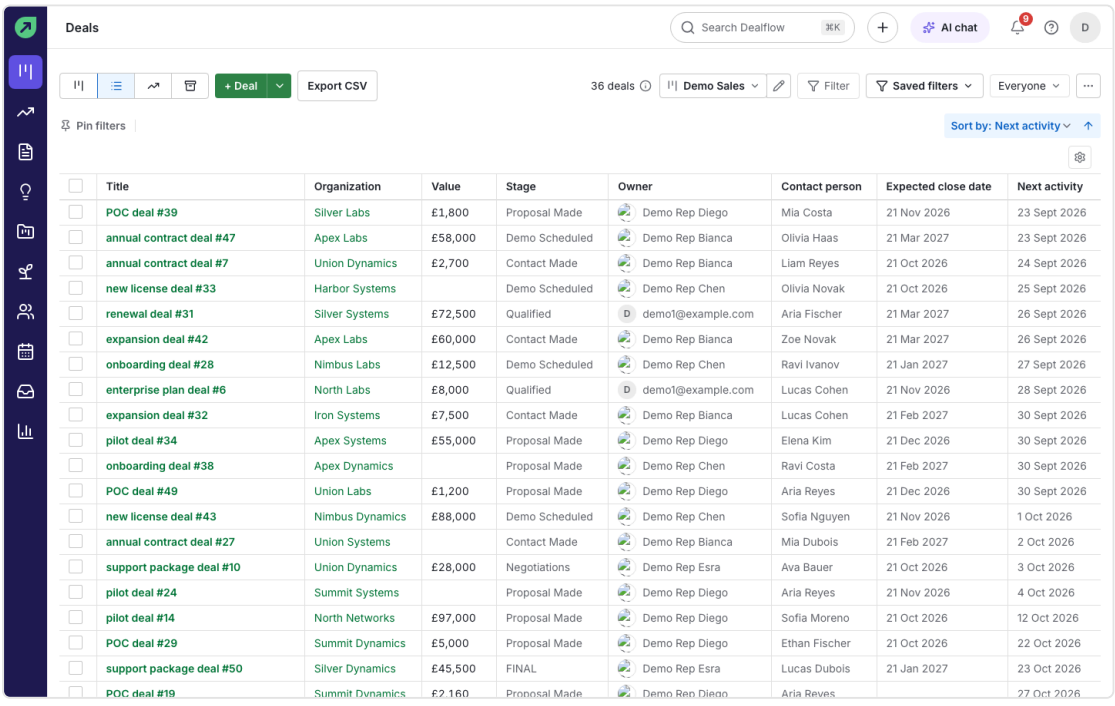

How to filter and sort the board

1. Select **Filter**.
2. Choose a saved filter such as **All open deals**, **My open deals** or **Rotting deals**, or select **Create new filter** to build your own. In the Create new filter dialog you can also describe the filter in plain English and select **Generate filter**.
3. Use the owner picker to see **Everyone** or one person, and **Sort by** to order the cards (for example by next activity or deal value).

Tip: Pin filters keeps your favourite filters visible above the board.

How to use the list view

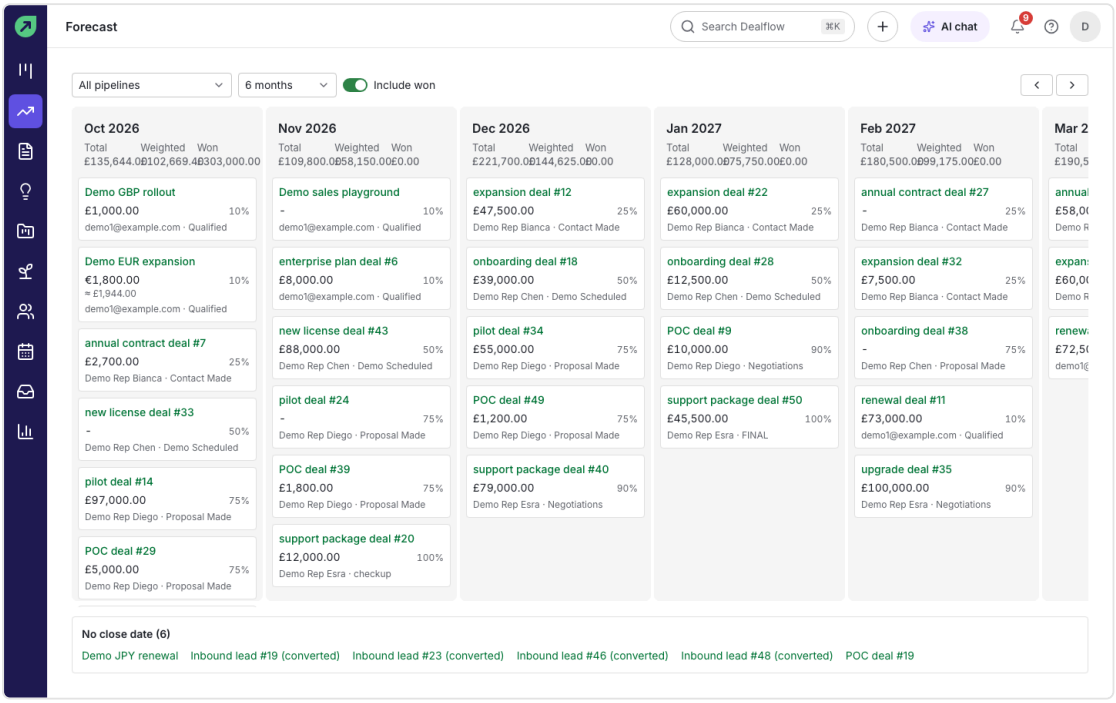

1. Select **List view** in the toolbar.
2. Sort by any column header. Select a title to open the deal.
3. Select **Export CSV** to download the list (if your permissions allow exports).

How to see archived deals

Select the archive icon in the toolbar. Archiving takes a deal off the board without deleting it; you can restore it from this list.

How to see the forecast

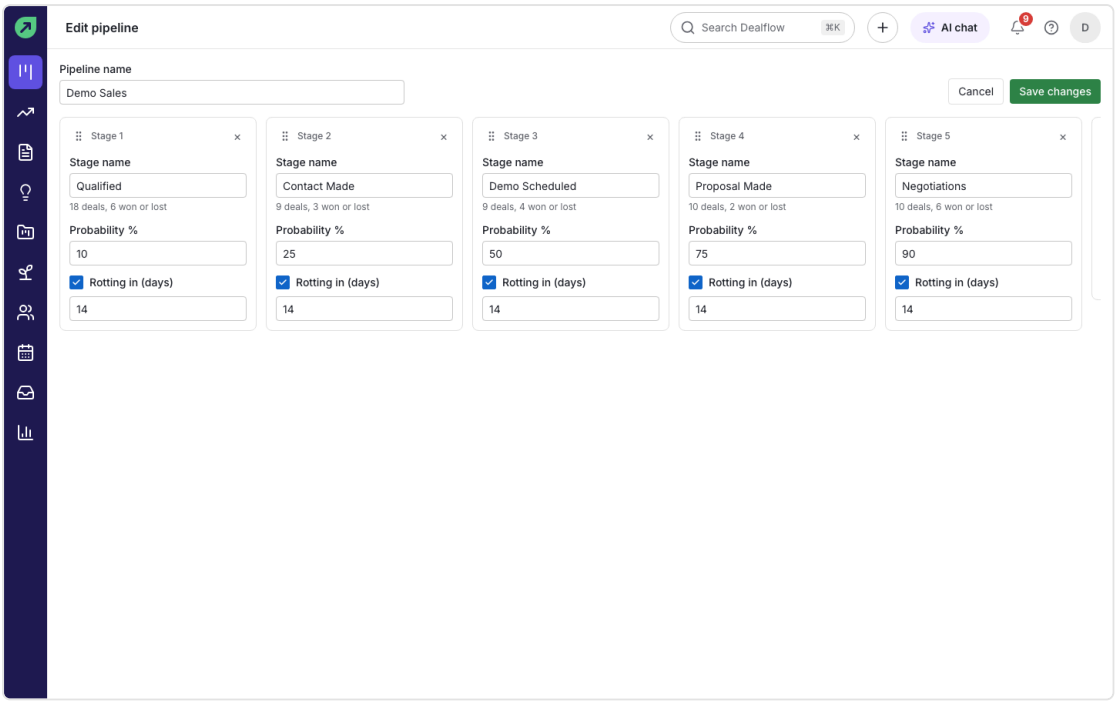

1. Select **Forecast** in the left rail.
2. Choose the pipeline, how many months to show, and whether to **Include won** deals.

Result: one column per month, showing each open deal by expected close date with its value and probability, plus the month's **Total**, **Weighted** and **Won** amounts. Deals without an expected close date are listed underneath.

How to edit a pipeline's stages

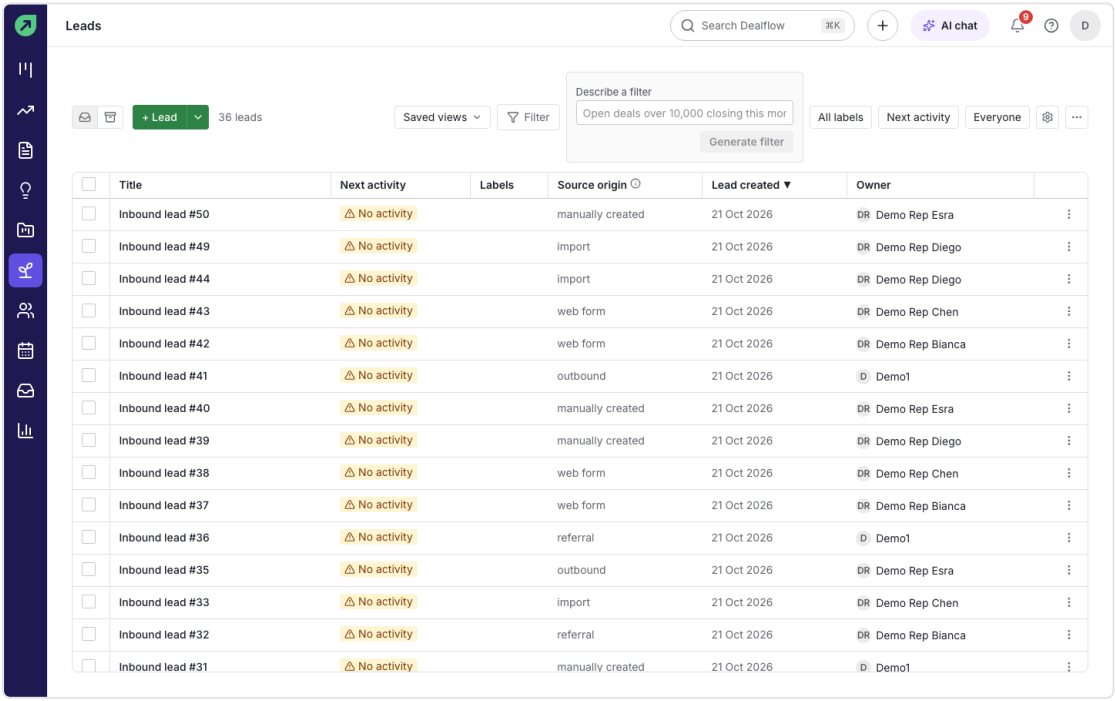

You need permission to manage pipelines.

1. On the board, select the pencil icon next to the pipeline name (or go to **Settings › Company settings › Pipelines**).
2. Rename stages, change each stage's **Probability %**, and turn on **Rotting in (days)** to flag deals that sit too long.
3. Select **Save changes**.

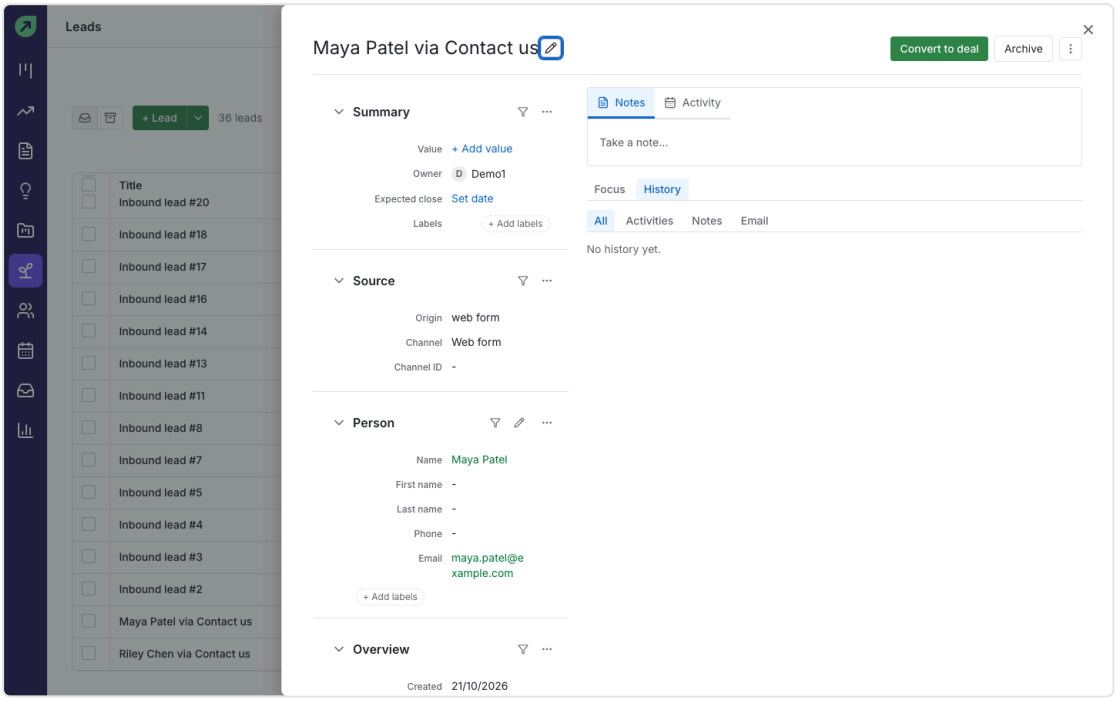

Leads

Leads are enquiries you have not qualified yet, for example from a web form.

How to work through your leads

1. Select **Leads** in the left rail.
2. Use **Saved views**, **Filter**, the label and owner pickers, or select **Ask AI**, describe the filter and select **Generate filter** (see AI features) to narrow the list.
3. Select a lead to open it.

How to convert a lead into a deal

1. Open the lead.
2. Select **Convert to deal**.

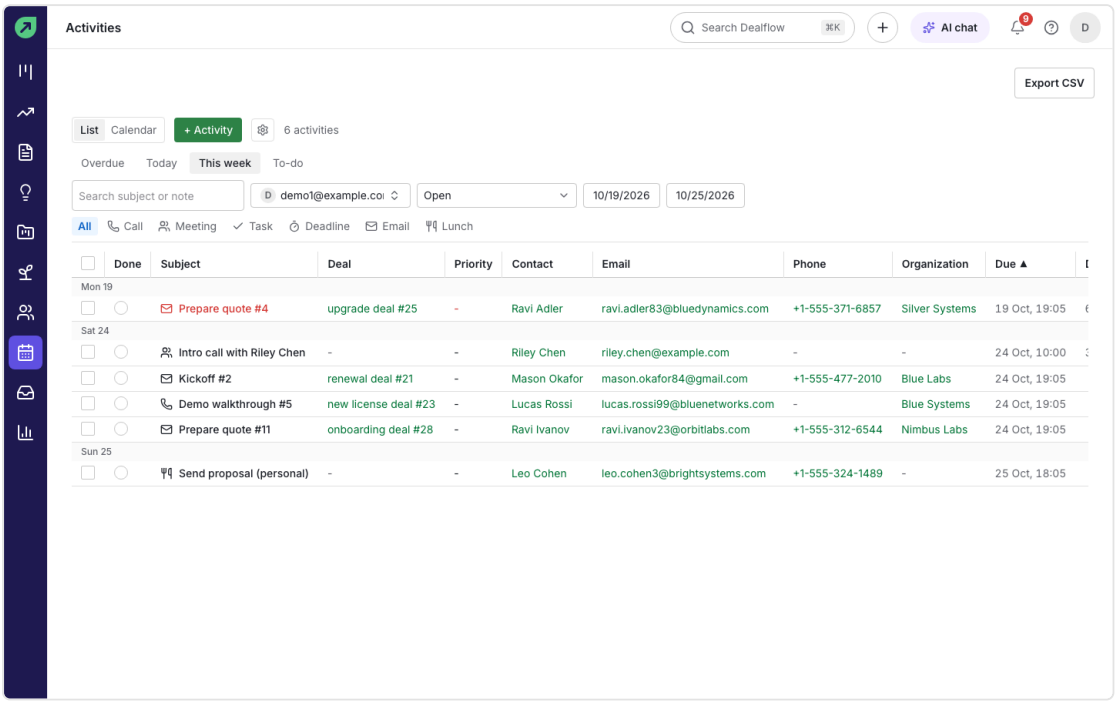

Result: a deal is created with the lead's details and the lead is marked as converted.

Tip: select **Archive** instead to clear a lead you will not pursue.

Activities and calendar

Activities are the calls, meetings, tasks, deadlines, emails and lunches that move deals forward. Every activity has a subject, a type and a due date, and can be linked to a deal, person or organization.

How to see what you need to do

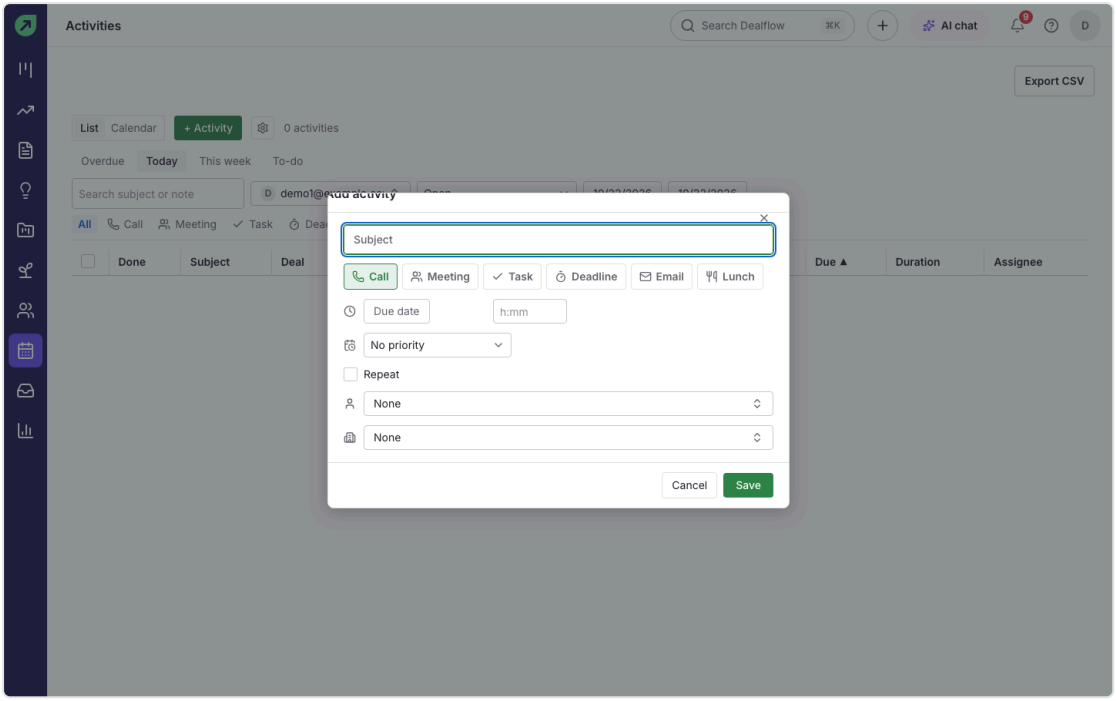

1. Select **Activities** in the left rail.
2. Choose **Overdue**, **Today**, **This week** or **To-do** at the top.
3. Narrow the list by owner, status (Open or Done), dates, or type (**Call**, **Meeting**, **Task**, **Deadline**, **Email**, **Lunch**).

Tips:

- Tick the box at the start of a row to mark the activity done.
- Select **Export CSV** to download the list.

How to schedule an activity

1. Select **+ Activity** (or press `n` then `a`, or choose **Activity** from Quick add).
2. Type a **Subject** and pick the type: Call, Meeting, Task, Deadline, Email or Lunch.
3. Set the due date and time, and the priority if you use one.
4. Link it to a deal, person or organization.
5. Select **Save**.

Result: the activity appears in your list, on the calendar, and on the linked records. If it is linked to a deal, the deal's next-activity dot turns green.

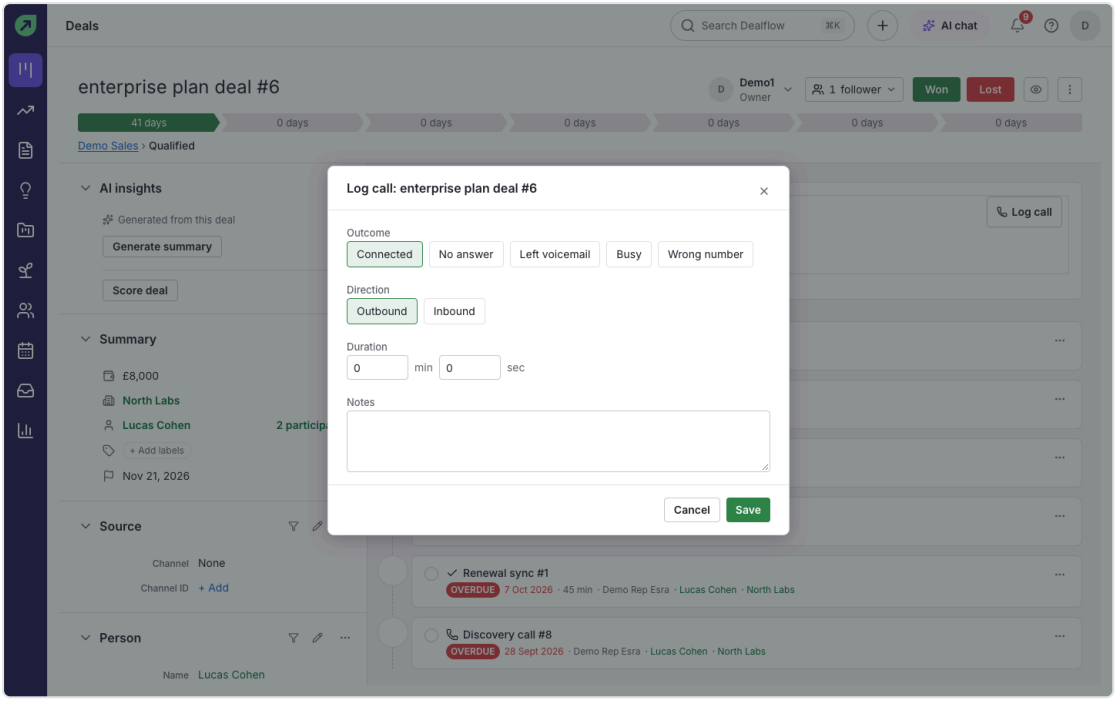

Tip: on a deal, the **Activity** tab under the deal header does the same thing with the deal already linked.

How to make an activity repeat

1. In the activity form, tick **Repeat this activity**.
2. Choose how often, and for weekly repeats tick the days (for example **Mon** and **Thu**).
3. Select **Save**.

Result: Dealflow creates the next occurrence each time you complete the current one, so your list only ever shows the next one.

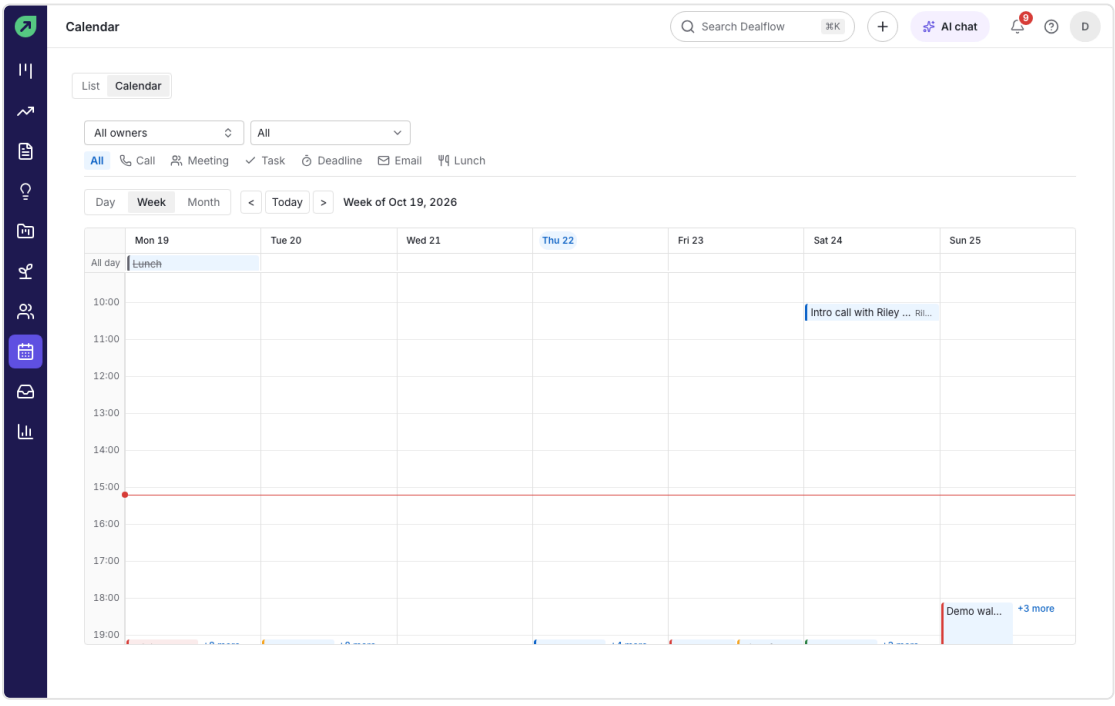

How to log a call

1. Open the deal, person or organization, and select **Log call** (or press `n` then `c`, or use **Log call** in the command palette).
2. Choose the **Outcome**: **Connected**, **No answer**, **Left voicemail**, **Busy** or **Wrong number**.
3. Choose the **Direction** (**Outbound** or **Inbound**), and enter the **Duration** and any **Notes**.
4. Select **Save**.

Result: a completed call activity is added to the record's history with its outcome, so you can filter calls by outcome later.

How to use the calendar

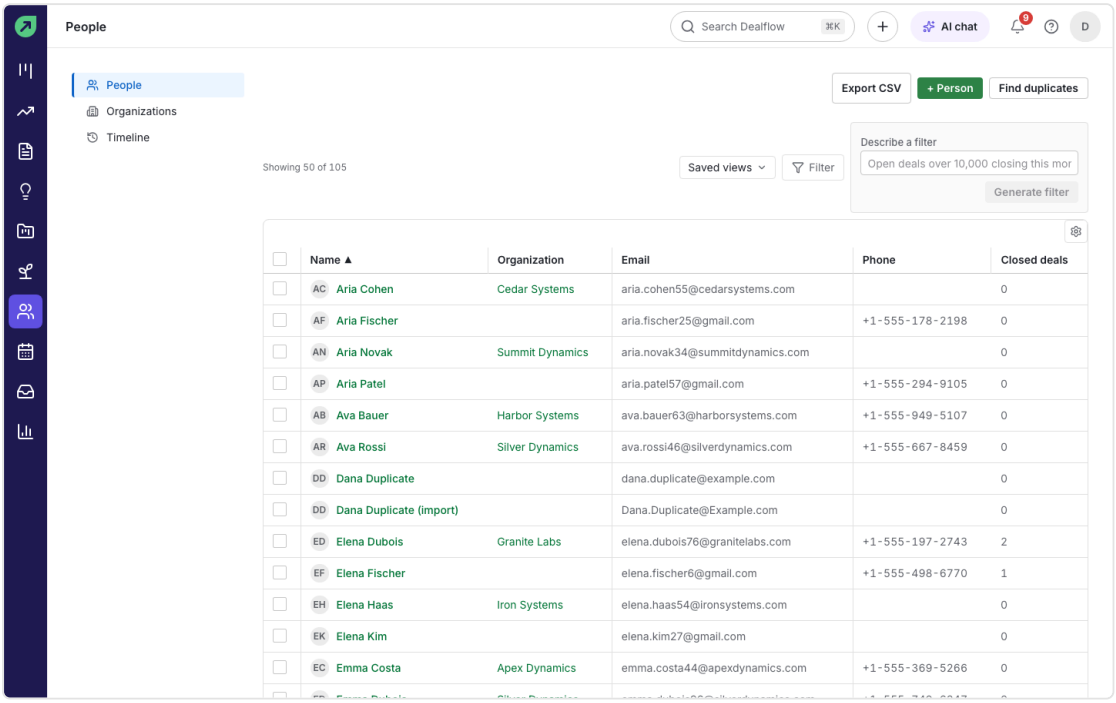

1. In **Activities**, select **Calendar**.
2. Choose **Day**, **Week** or **Month**, and move between periods with **<**, **Today** and **>**.
3. Filter by owner and type at the top.
4. Select an empty slot to add an activity at that time, or select an activity to open it.

Tip: the red line marks the current time.

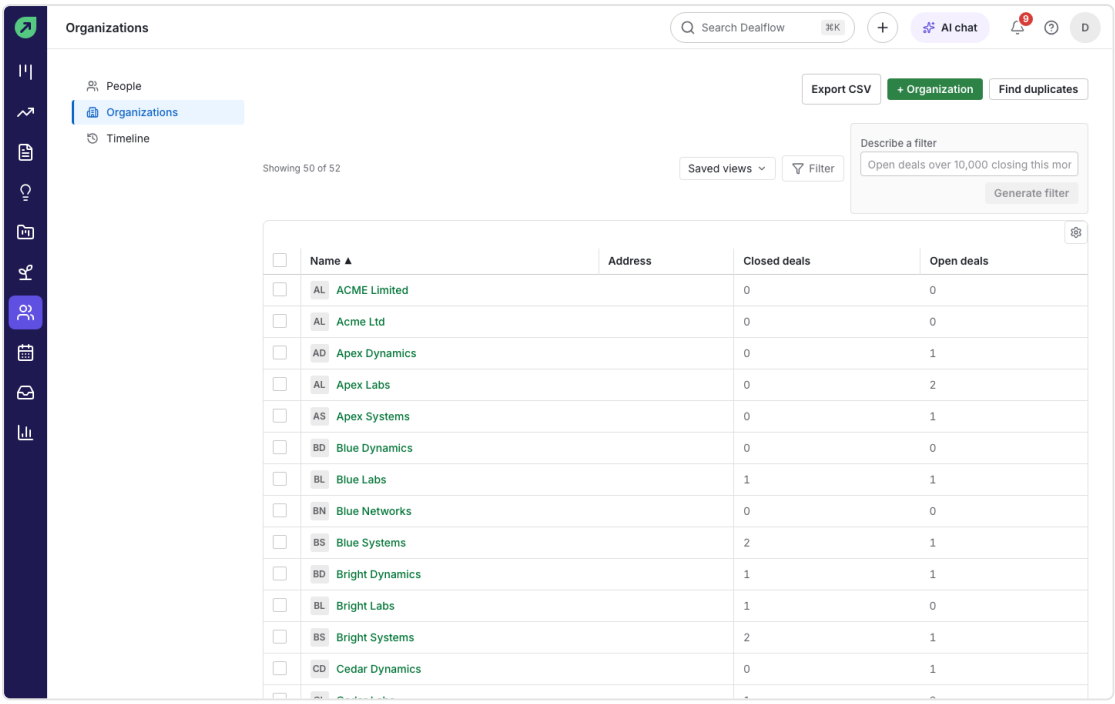

Contacts and organizations

People are the individuals you deal with. **Organizations** are the companies they work for. Both live under **Contacts** in the left rail. The three views, **People**, **Organizations** and **Timeline**, sit in a view switcher at the top of the page, not in a panel of their own.

How to find a person or organization

1. Select **Contacts** in the left rail. **People** opens first; use the view switcher in the toolbar to move between **People**, **Organizations** and **Timeline**.
2. Type in the search box, use **Saved views** or **Filter**, or select **Ask AI**, describe the filter and select **Generate filter** (see AI features).
3. Select a name to open the record.

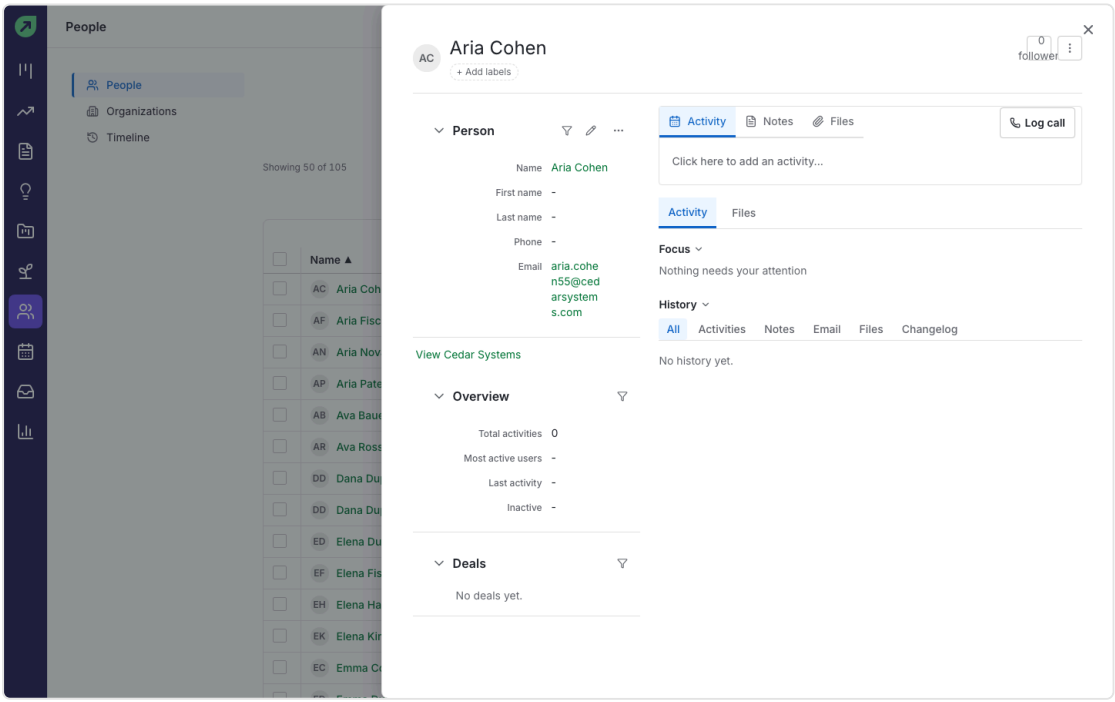

How to add a person or organization

1. Select **+ Person** or **+ Organization** (or press `n` then `p` or `n` then `o`).
2. Fill in the name and any details you have, such as email, phone and organization.
3. Save.

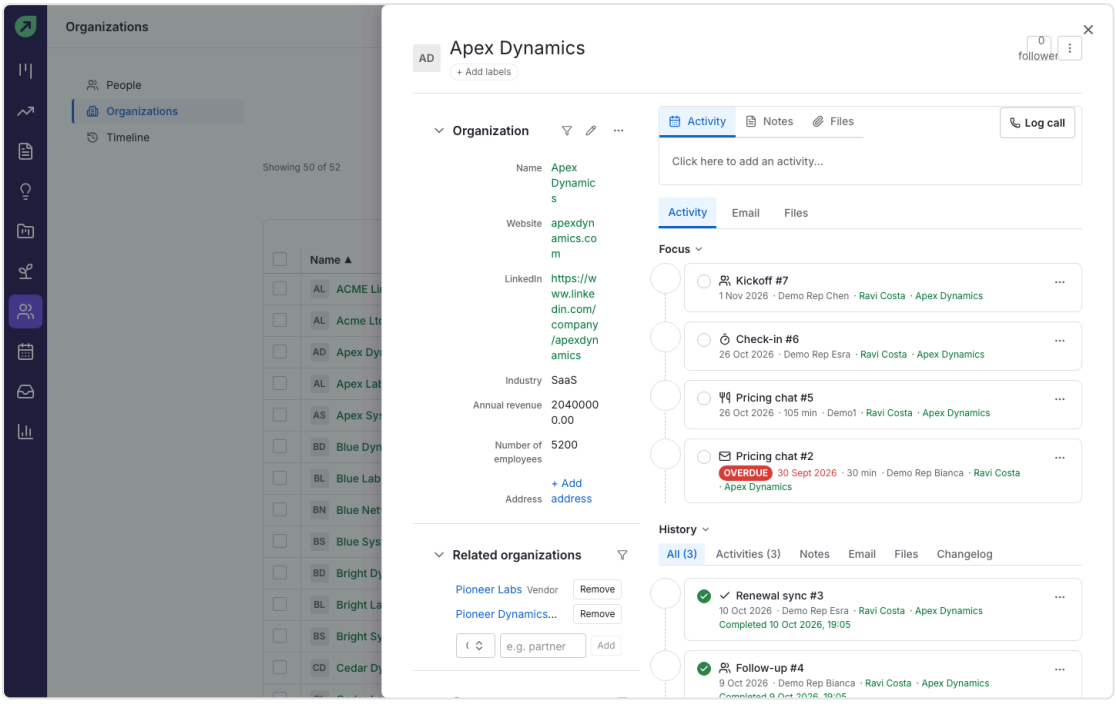

Result: the record opens and is ready for activities, notes and email.

What a person or organization shows

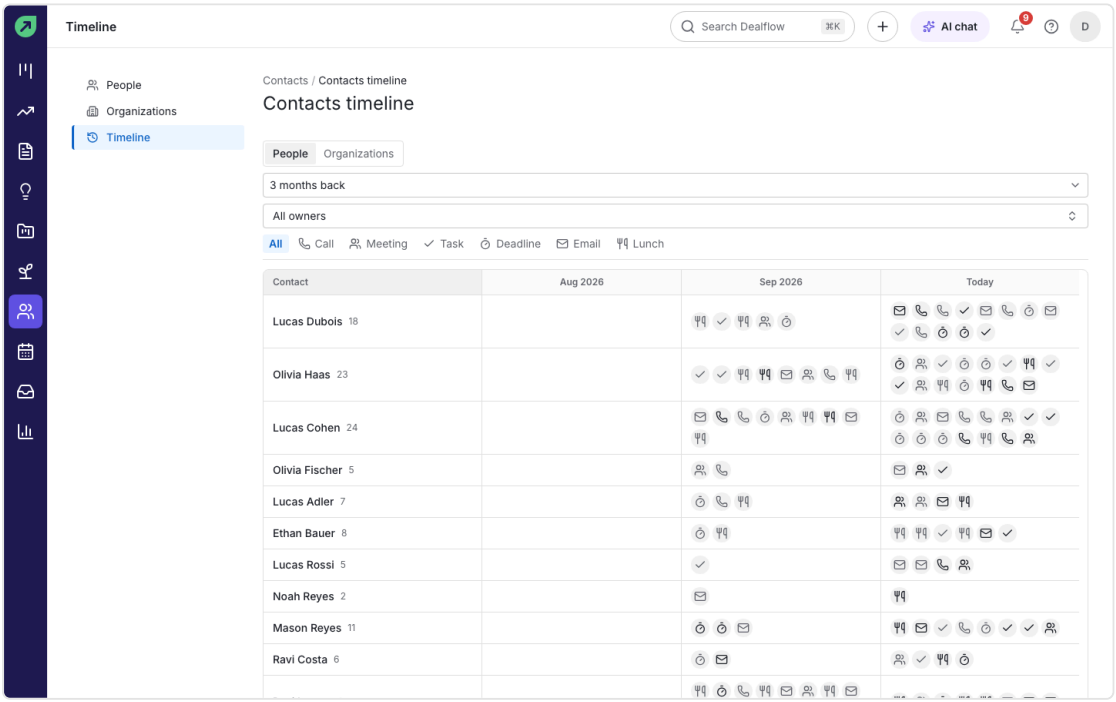

- **Details** on the left: name, phone, email, labels, followers and company-specific fields. Select a value to edit it in place.

- **Overview:** total activities, the most active users, the last activity and how long the contact has been inactive.
- **Deals** linked to the contact.
- **Activity**, **Notes**, **Files** and **Log call** on the right, with the full **History** below.

Organizations also list **Related organizations** (for example a parent company) and the people who work there.

How to see recent contact across all your contacts

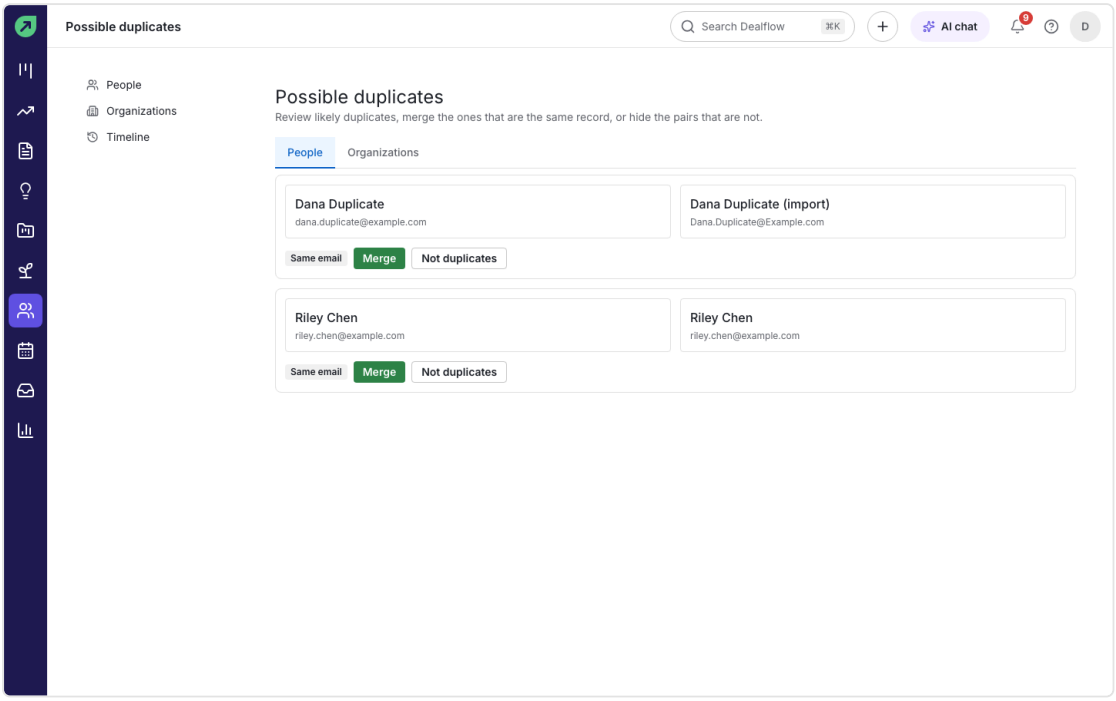

1. Select **Contacts** in the left rail, then **Timeline** in the view switcher.
2. Choose **People** or **Organizations**, how far back to look, the owner and the activity types.

Result: one row per contact, with an icon for each activity in each week, so you can spot contacts nobody has spoken to lately.

How to merge duplicates

You need permission to merge contacts.

1. In **People** or **Organizations**, select **Find duplicates**.
2. Review each pair. The reason they match (for example **Same email**) is shown underneath.
3. Select **Merge** to open the merge dialog with both records selected, choose which values to keep, and confirm. Or select **Not duplicates** to hide the pair for good.

Result: the two records become one.

Tip: people match on the same email, the same phone number or the same name at the same organization. Organizations match on name (ignoring suffixes such as Ltd) or website domain.

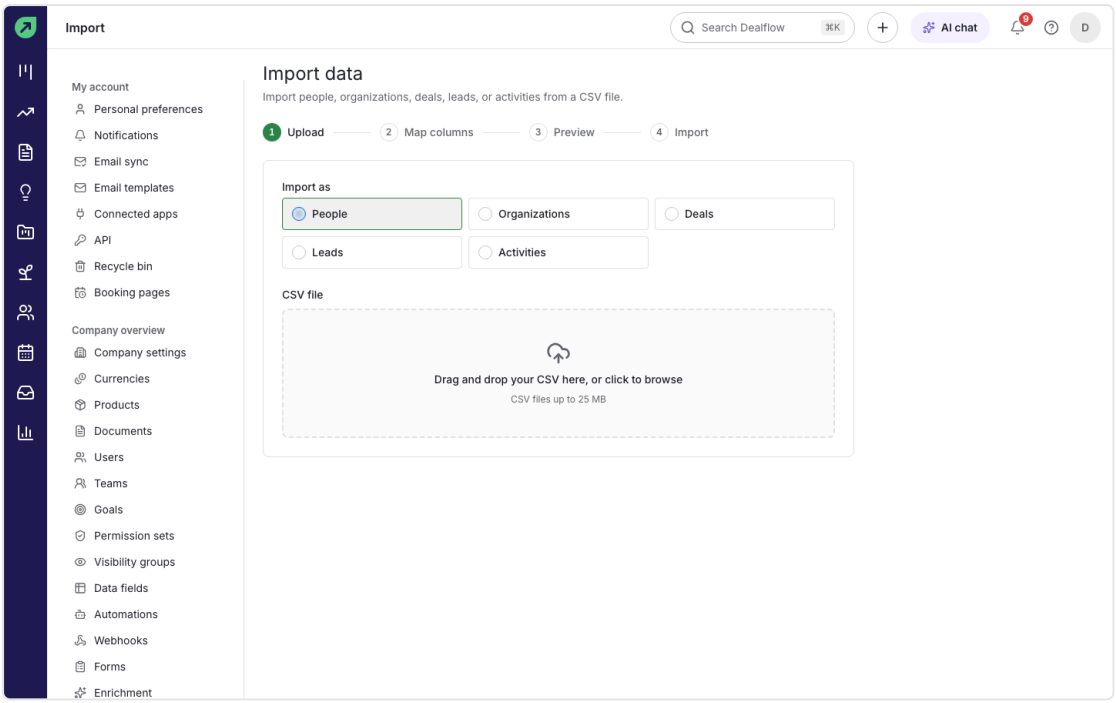

How to edit many contacts at once

1. In the people or organizations list, tick the boxes next to the records.
2. Use the bulk actions that appear to change a field for all of them.

You need the bulk-edit permission for this.

How to import contacts from a CSV file

You need permission to import data.

1. Go to **Settings › Import data** and select **New import**.
2. Choose what you are importing: **People**, **Organizations**, **Deals**, **Leads** or **Activities**.
3. Drag your CSV file onto the page or select it.
4. **Map columns**: match each column in your file to a Dealflow field.
5. **Preview** the result and then **Import**.

Result: the records are created, and the import appears in the **Import data** list.

Tip: if an import goes wrong, select **Undo** next to it in the **Import data** list. Dealflow removes the records that import created.

How to export contacts

In the people or organizations list, select **Export CSV**. The file contains the records your current filter shows. You need the export permission.

How to fill in missing details automatically (optional)

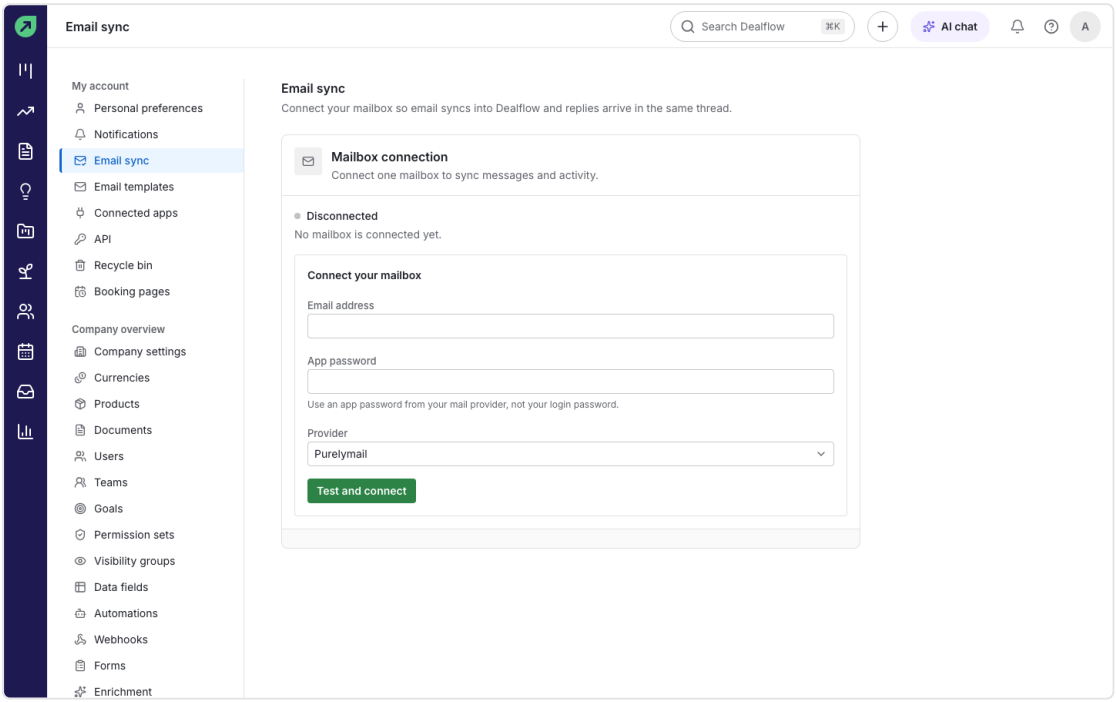

If your admin has connected an enrichment provider (Apollo, RocketReach or GetProspect) in **Settings › Enrichment**, a **Fill the gaps** action can complete a person or organization from that provider. This is off unless your admin sets it up, and turning it on sends the record's name, email or domain to that provider.

Email

Dealflow connects to your own mailbox over IMAP and SMTP, so email you send and receive appears in Dealflow, threaded and linked to the right deals and contacts. Replies from Dealflow go out through your normal mail server and land in your Sent folder.

How to connect your mailbox

You need an **app password** from your mail provider. This is a separate password made for one app, not the password you use to sign in to your mail. Your provider's help pages explain how to create one.

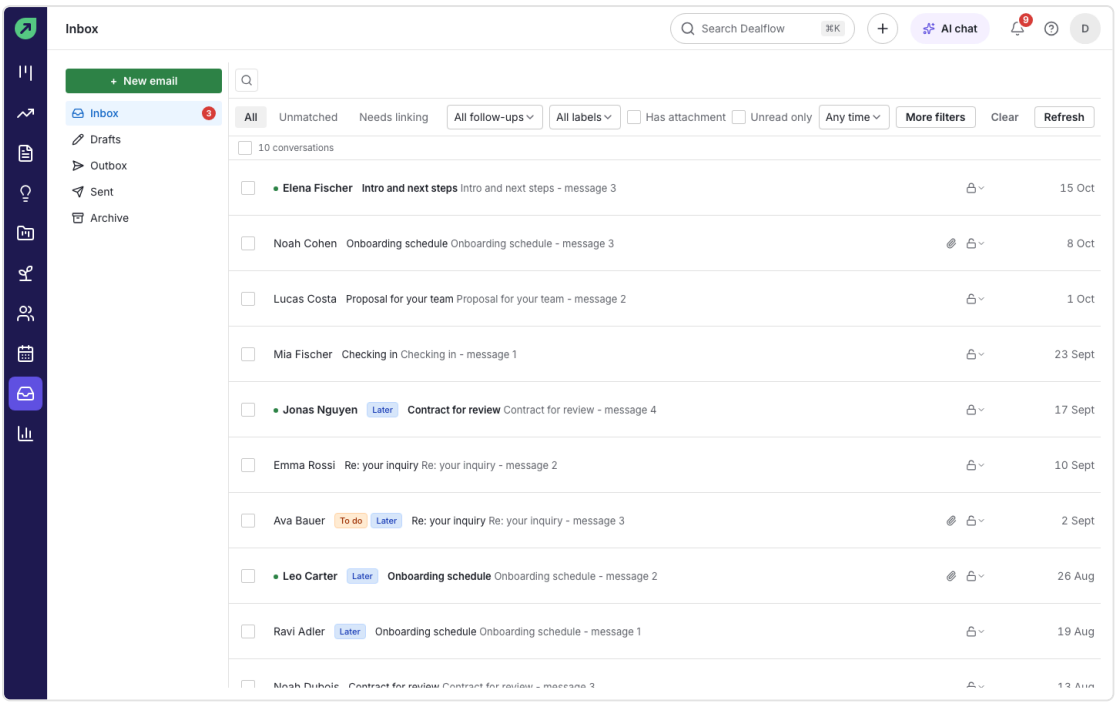

1. Go to **Settings › Email sync**.
2. Type your **Email address** and the **App password**.
3. Choose your **Provider**: **Purelymail**, or **Other IMAP/SMTP server** and enter the server details your provider gives you.
4. Select **Test and connect**.

Result: the status changes to **Connected** and Dealflow starts syncing your recent mail. Older mail is fetched in the background.

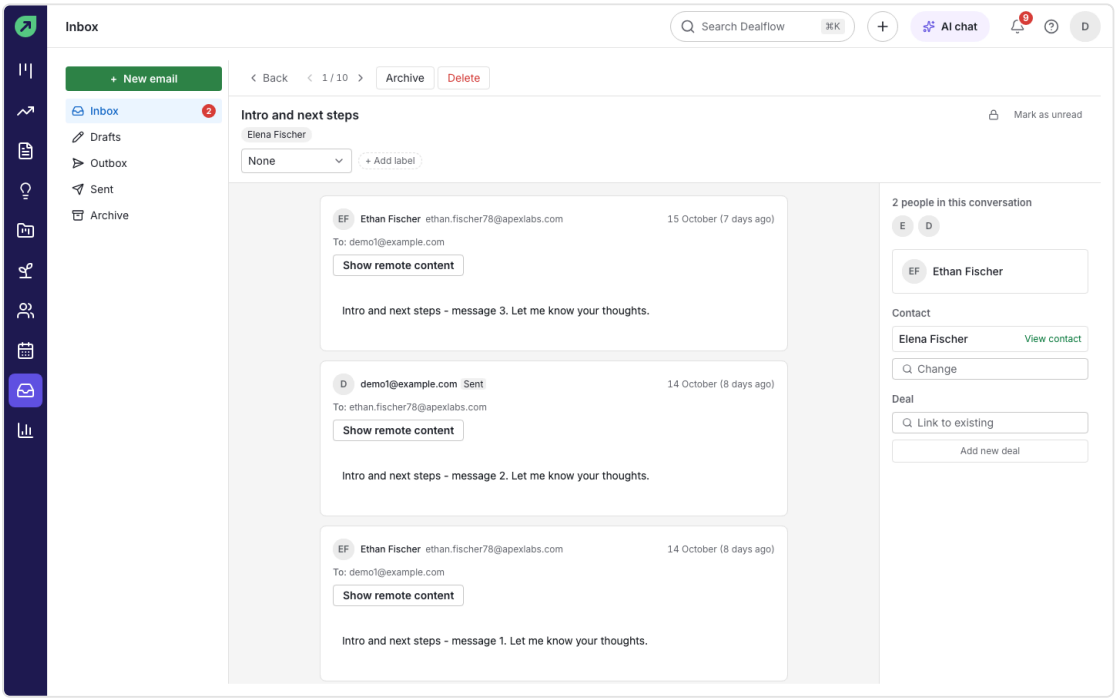

Tips:

- If the test fails, check the address and app password first. Most failures are a mistyped app password.
- To stop syncing, select **Disconnect** on the same page.

How to read your email

1. Select **Inbox** in the left rail.
2. Use the folders on the left: **Inbox**, **Drafts**, **Outbox** (scheduled email), **Sent** and **Archive**.
3. Narrow the list with **All**, **Unmatched** (email not yet linked to a contact), **Needs linking**, follow-up status, labels, **Has attachment**, **Unread only** and the date range.
4. Select a conversation to open it.

Result: the conversation opens with every message in order. The right-hand panel shows the people in the conversation and the contact and deal it is linked to.

Tips:

- Images from outside senders are hidden until you select **Show remote content**.
- **Archive**, **Delete** and **Mark as unread** are at the top of the conversation.

How to link an email to a deal or contact

1. Open the conversation.
2. In the right-hand panel, under **Deal**, select **Link to existing** and choose the deal, or select **Add new deal**.
3. Under **Contact**, use **Change** to pick a different person if needed.

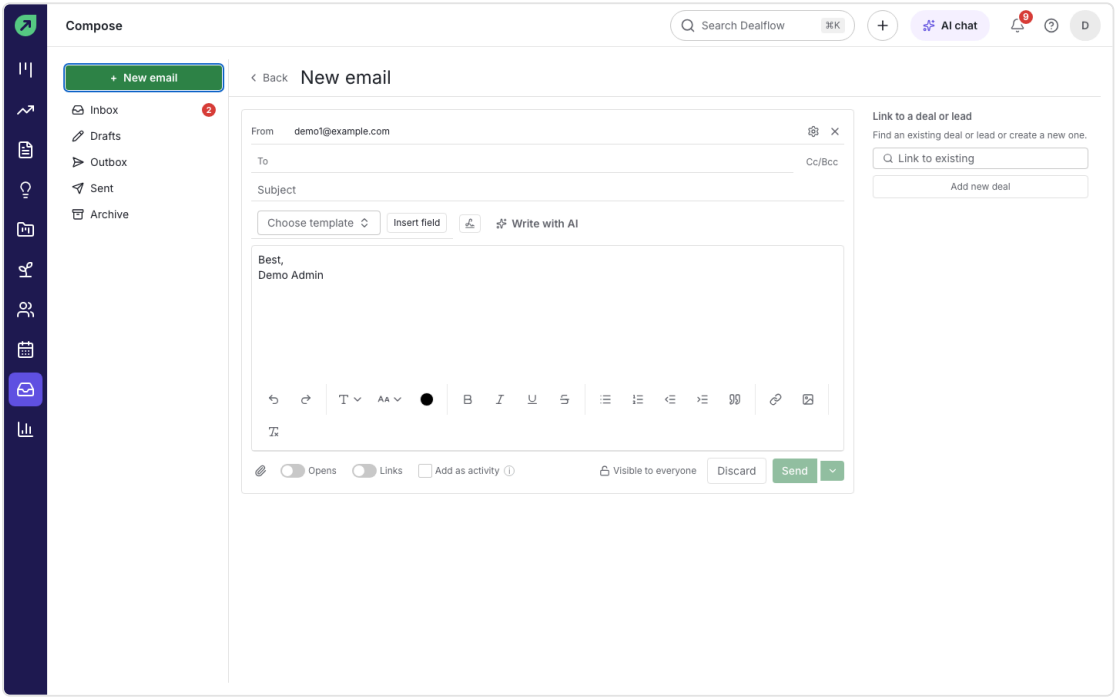

Result: the email shows in the deal's and contact's history under **Email**.

How to reply

1. Open the conversation and select **Reply**.
2. Write your reply and select **Send**.

Result: the reply is sent from your mailbox and added to the same conversation.

How to write a new email

1. Select **+ New email** in the inbox (or **Email** in Quick add, or the **Email** tab on a deal or contact).
2. Fill in **To** and the **Subject**. Use **Cc/Bcc** if you need them.
3. Write your message. You can:
   - pick a saved template with **Choose template**,
   - add a merge field such as the person's name with **Insert field**,
   - ask the AI to write it with **Write with AI** (see AI features),
   - attach files with the paperclip.
4. Select **Send**, or use the arrow next to it and choose **Send later** to schedule it.

Result: the email is sent (or waits in **Outbox** until its time), and appears in **Sent**.

Tips:

- **Link to a deal or lead** on the right keeps the email with the right record.
- **Visible to everyone** controls whether teammates can read the conversation. Turn it off for private email.

How to see whether your email was opened

1. Before sending, leave the **Opens** and **Links** switches at the bottom of the email on.
2. Send the email.

Result: when the recipient opens the email or selects a link in it, Dealflow records it and can notify you ("Your email was opened").

Tip: opens are counted only when the recipient's mail app loads images, so "not opened" does not always mean "not read".

How to set a follow-up reminder on a conversation

Open the conversation and use the follow-up control under the subject to mark it (for example **To do** or **Later**). Use the follow-up filter in the inbox to see everything you still need to chase.

How to choose a layout or preview an email

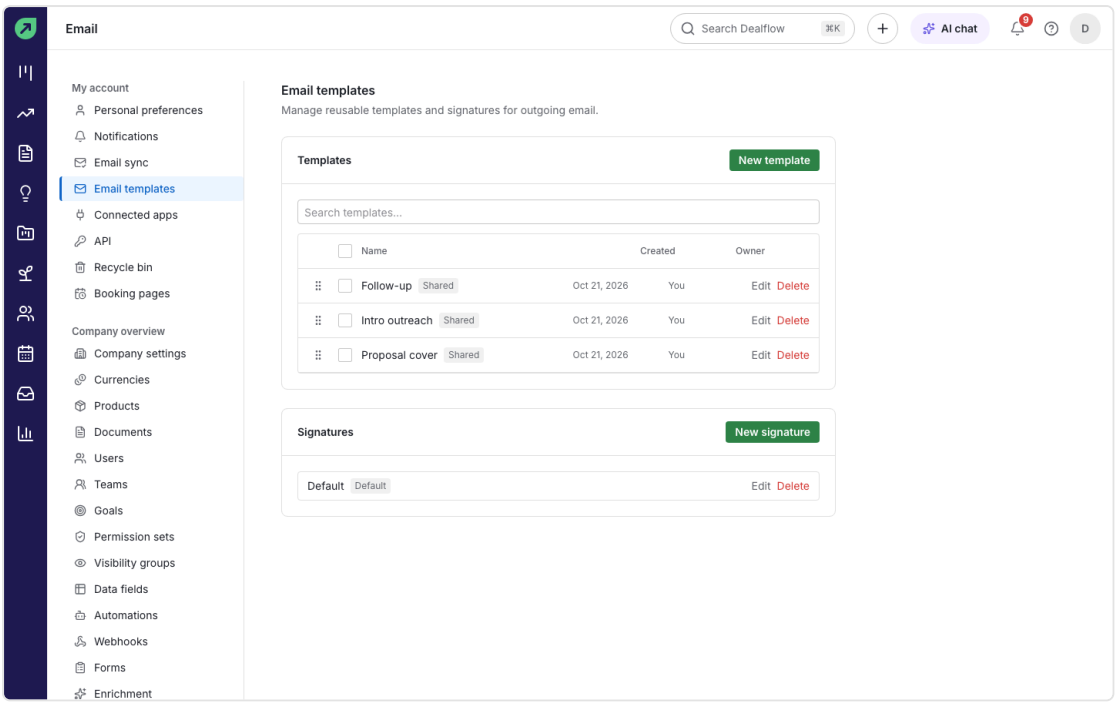

When you write an email, Dealflow wraps it in your company design. The **Layout** control in the composer footer shows the current choice:

- **Branded**: your logo, colours and footer, on a card.
- **Minimal**: a light reply layout with no card.
- **Plain**: exactly what you typed, with no layout.

The default for a new email and for replies is set in **Settings › Email design**. Your choice here applies to this message only.

To see exactly what the recipient will get, select **Preview**. The preview uses the same renderer as the send, including your signature, at 600 or 375 pixels wide.

How to manage templates and signatures

1. Go to **Settings › Email templates**.
2. Select **New template**, give it a name, subject and body, and choose whether to share it with the team.
3. Under **Signatures**, select **New signature** to add the sign-off used at the bottom of your emails.

Result: shared templates appear in everyone's **Choose template** list.

Campaigns

Campaigns send designed email to a group of contacts, then show you what happened: who received it, who opened it, who clicked, who unsubscribed and who bounced. Dealflow also has automated campaigns (sequences) for follow-ups that run on their own.

Campaigns are separate from your day-to-day email in Email. Everyday email goes from your own mailbox; campaign email goes through the campaign sending account an admin sets up below.

Before you start

You need one of these permissions:

- **Campaigns: view** to see campaigns, reports and insights.
- **Campaigns: edit** to build and change campaigns and sequences.
- **Campaigns: send** to send, schedule, pause and cancel.
- **Marketing: manage** to change the sending settings, senders, postal address and consent defaults.

Admins have all four. An admin also needs to set up a sending account and a postal address before anyone can send.

How to set up sending

1. Go to **Settings › Campaigns**.
2. Under **Senders**, select **Add sender**, enter the **From name** and **From email**, then select **Add and verify**.
3. Open the verification email and select the verification link.

Result: the sender shows **Verified**. A campaign cannot send until its sender is verified.

4. Under **Postal address**, enter your company's postal address and select **Save settings**.

Result: the address appears in the footer of every campaign. Campaigns cannot send without it.

5. Under **Consent**, decide whether form sign-ups need **double opt-in**. Leave it on unless you have a specific reason to change it.
6. Under **Sending**, check the **Send rate per minute**. The number is a ceiling set by the server; you can lower it here for a smaller sending account.
7. Under **Domain check**, enter your sending **Domain** and **DKIM selector**, then select **Check**.

Result: Dealflow checks the SPF, DKIM and DMARC records it can find and shows a pass or an item to fix for each.

Tips:

- Use a real role address such as `news@yourcompany.com` rather than a person's address, so replies and bounces have one owner.
- The bounce mailbox is optional. When an admin configures it, the **Bounces** section shows when it was last checked and how many messages it processed.

How to change a contact's marketing status

1. Open the person from **Contacts › People**.
2. In the **Marketing** section, select **Change status**.
3. Choose the new status and, for **Subscribed**, choose the **Consent basis** that applies.
4. Select **Save**.

Result: the status changes, the person is included in or excluded from future campaigns, and the change is added to their consent history.

Statuses:

Status	What it means
Subscribed	The person agreed to receive campaign email. They are included in campaigns.
Pending	A double opt-in email was sent but the person has not confirmed yet. They are excluded until they confirm.
Not subscribed	No marketing consent on record. They are excluded.
Unsubscribed	The person opted out, through a campaign link or a manual change. They are excluded.
Bounced	The address hard-bounced. They are suppressed from future sends.

Select **Consent history** to see every status change with its date, source and consent basis. Keep this history: it is the record that shows why each person is on your list.

How double opt-in works

When **Require double opt-in for form sign-ups** is on:

1. A visitor submits a form with the marketing consent box ticked.
2. Dealflow creates the person as **Pending** and sends them a confirmation email.
3. The visitor selects the confirmation link. The link opens a page that asks them to confirm.
4. After they confirm, the person becomes **Subscribed**.

The link expires after 30 days. A pending person is never included in a campaign. If they do not confirm, they stay pending and receive no campaign email.

The confirmation page can be opened once. A confirmation email is only sent when the form's consent box was ticked; a form submission without it does not change anyone's marketing status.

Tip: the daily number of confirmation emails is capped for the whole install. If a form is being abused, the cap slows the abuse rather than letting it consume your sending account.

How to build a campaign

1. Go to **Campaigns** and select **+ Campaign** for a blank campaign, or open the **Templates** tab and select **Use** on a starter (Newsletter, Announcement, Event invitation or Simple text).
2. In **Details**, fill in:
   - **Name**: internal only; recipients never see it.
   - **Type**: newsletter, announcement, promotion, event, nurture or other. It is used for reporting.
   - **Sender**: a verified sender from Settings.
   - **Subject** and **Preview line**.
   - **Reply-to**, if replies should go somewhere other than the sender.
3. Select **Recipients** and choose a **Saved filter**, or select **Build a filter** to make the audience for this campaign.

Result: the page shows how many people will receive the campaign and why the others are excluded: not subscribed, pending, unsubscribed, bounced, suppressed, without an email or a duplicate email.

4. Select **Content** and build the email. Add blocks from the left, select a block in the preview to edit it on the right, and use **Desktop** or **Mobile** to check both widths.
5. Select **Send test**, enter up to five email addresses of active Dealflow users, choose a sample person for merge fields, and select **Send test**.

Result: the test email arrives with the real subject, content and footer. Its unsubscribe link is a test placeholder, so it does not change anyone's marketing status. The Review checklist records that a test was sent.

6. Select **Review** and read the checklist. Every **fail** blocks sending; **warning** items do not.

The checklist covers the subject, a verified sender, the postal address, at least one recipient, image alt text, button URLs, the 100 KB size limit and the domain check.

How to send now or schedule

1. On **Review**, select **Send now**.
2. Confirm the number of recipients.

Result: the campaign status changes to **Sending**, then **Sent**. The report link appears on the campaign list.

To send later:

1. On **Review**, select **Schedule**.
2. Pick the date and time and select **Schedule**.

Result: the campaign waits as **Scheduled** and sends at that time. The time is shown in your browser's time zone.

While a campaign is **Sending**, **Pause** stops the next batch. **Resume** continues it. **Cancel campaign** stops it for good; recipients who already received it keep their copy.

Tips:

- Send a test to yourself after any change to the content, the merge fields or the footer.

- To reuse a sent campaign, open its row menu and select **Duplicate**. The copy is a draft with the same content and audience, so you can change it before sending.
- Drafts can be deleted from the same row menu.

How to read a campaign report

1. Go to **Campaigns** and select **Report** on a **Sending**, **Paused** or **Sent** campaign.
2. Read the tiles: recipients, delivered, unique opens, unique clicks, click-to-open rate, unsubscribes, bounces and spam reports.
3. Open the chart to see opens and clicks over time. A new campaign is grouped by hour; older campaigns are grouped by day.
4. Scroll to **Links** to see clicks per link, and to **Recipients** to see each person's status.

Result: you can tell whether the subject worked (opens), whether the content worked (clicks) and whether the list is healthy (bounces and unsubscribes).

Tips:

- Mail apps and security scanners often load the tracking image without a person reading the email. Leave **Include machine opens** off for the most useful open rate, and turn it on when you need to match a mail provider's number.
- The recipients table can be filtered by status. **Download CSV** exports the full recipient list, subject to your **Export data** permission.
- Opens are counted only when the recipient's mail app loads images. A missing open does not always mean the email was not read.

How to compare campaigns

1. Go to **Campaigns** and open the **Insights** tab.
2. Choose a date range, a campaign **Type** and a **Sender**.
3. Read the table: each row is a campaign, with its sent date, recipients and rates.
4. Select a column heading to sort. The **Your average** row shows the average rate across the campaigns in view.
5. Use the arrow next to a rate to see whether it is more than 10% above or below your average.

The **Automated** tab shows the same measures for each active or paused sequence and for each step, so you can see where people drop off in a follow-up.

Tip: compare campaigns of the same type and audience size. A small campaign with three recipients will swing the average much more than a campaign with three thousand.

How to automate follow-ups with a sequence

A sequence is a series of email steps and waits that runs for each enrolled person. Each email step sends through its own hidden campaign, so it uses the same sender, footer, tracking and unsubscribe rules as a normal campaign.

1. Go to **Campaigns** and open the **Automated** tab.
2. Select **+ Sequence**.
3. Give it a **Name** and choose a verified **Sender**.

4. Add steps:
    - **Email**: write the subject and content.
    - **Wait**: choose how long to wait before the next step.
5. Set the **Send window**: the start and end hour, whether to send on weekdays only, and the time zone it should use.
6. Choose the **Entry** rules: whether **Manual enrollment** and **Automation** may enroll people, and optionally a saved people filter. Choose the **Exit** rules: when the deal is won, when the person replies, or a saved filter.
7. Select **Save**, then **Activate**.

Result: the sequence status becomes **Active** and Dealflow starts any new enrollments on the next run.

To enroll people by hand:

1. Go to **Contacts › People** and filter to the people you want.
2. Tick their checkboxes.
3. In the bulk bar, choose **Enroll in sequence** and pick the sequence.

Result: each person is enrolled once. If they are already active in that sequence, Dealflow does not add them twice.

Tips:

- A person leaves the sequence when they finish the last step or when an exit rule matches. A deal won or a reply stops the remaining steps.
- **Pause** stops new sends without deleting the sequence. **Delete** removes it and its enrollments; the sent emails stay in each person's history.
- The **Enrolled** count on the sequence list shows its size at a glance.
- A sequence's send window is evaluated in the sequence's time zone, not your browser's.

How to handle unsubscribes and bounces

Every campaign footer contains your postal address and an unsubscribe link.

- **Unsubscribe link**: opens a page where the person can confirm the unsubscribe, and resubscribe later if they change their mind. It does not require a Dealflow login.
- **One-click unsubscribe**: mail apps show an **Unsubscribe** button at the top of the message. It records the opt-out immediately, without opening a page.
- **Hard bounce**: the address is marked **Bounced** and suppressed from future sends.
- **Soft bounce**: recorded on the report. Dealflow does not suppress the address unless the bounce becomes hard.
- **Spam complaint**: recorded on the report. Treat it as an opt-out and look at what changed in that send.

Result: unsubscribed and bounced people are excluded from every later campaign and sequence, even if they match the filter.

Tips:

- Do not delete a person to "remove" them from a campaign. Deleted contacts keep their suppression record; use **Change status** instead.

- If someone asks to be forgotten, use the contact deletion flow rather than only unsubscribing, and follow your company's data-retention policy.
- Check the **Bounces** section in Settings if hard bounces suddenly rise. A bounce mailbox catches asynchronous bounces that arrive after the send.

Compliance tips

- Send only to people who agreed to hear from you. Keep the consent basis and the consent history up to date.
- Always keep the postal address and unsubscribe link in the footer. Do not edit them out.
- Use a sending domain you control. Publish SPF, DKIM and DMARC records and check them on **Settings › Campaigns**.
- Use a reputable bulk SMTP provider for larger lists. Put its credentials in the campaign sending settings, not your everyday mailbox.
- Warm up a new domain or provider slowly. Start with engaged contacts and a lower rate, then increase it.
- Make the subject and the content match what the person signed up for. Clear, specific email gets fewer spam reports.
- Test every campaign before sending, including the merge fields and both the desktop and mobile preview.

Troubleshooting

Problem	What to check
Send now is disabled	A checklist item is a fail. Open **Review** and read the item; usually the sender is unverified or the postal address is empty.
The campaign says **Sending** for a long time	The rate per minute and the batch size limit each run. Large campaigns take several batches. Check the worker is running (see Self-hosting).
A person did not receive the campaign	Their marketing status may be pending, unsubscribed or bounced. Open their **Marketing** section and read the consent history.
The test email did not arrive	The recipient must be an active Dealflow user. Check the address you typed and your mail provider's spam folder.
Opens look too high	Turn off **Include machine opens** on the report.
A form sign-up stays pending	The person has not opened the confirmation link, or the link expired after 30 days.

Notifications

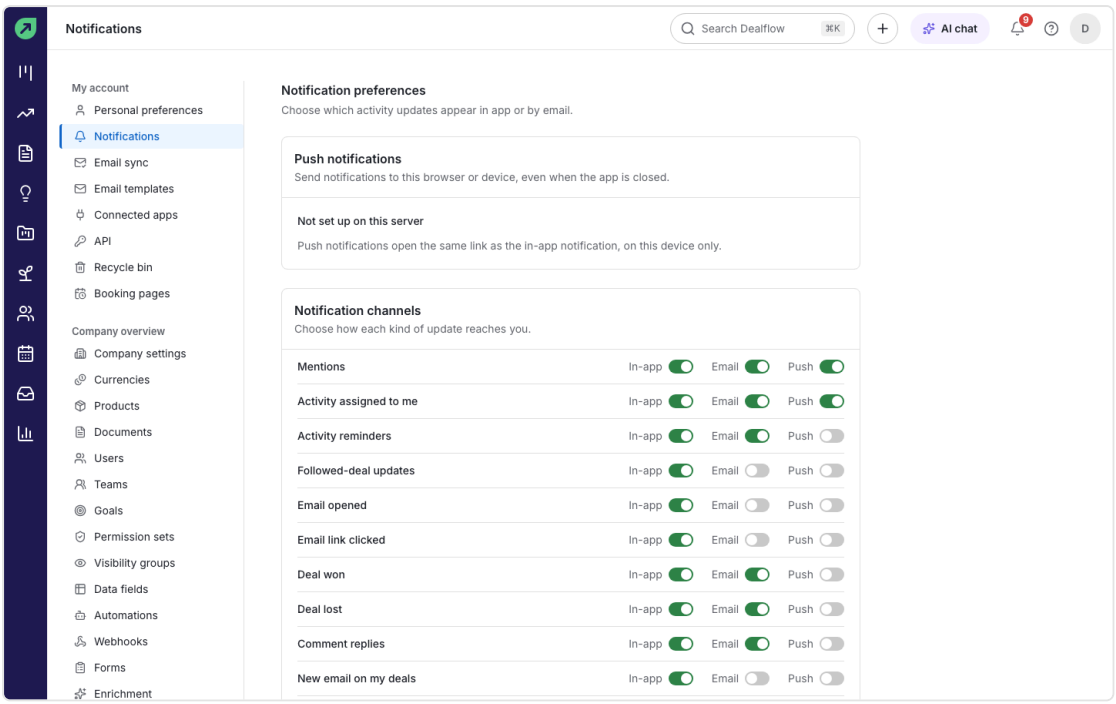

Dealflow tells you when something needs your attention: you were mentioned, an activity was assigned to you, a deal you follow was won, a customer viewed or accepted a quote, an email you sent was opened, and more.

How to read your notifications

1. Select the bell in the top bar. A red badge shows how many are unread; it reads 9+ when there are more than nine.
2. Read the list, grouped into **Today** and **Earlier**. Unread items have a blue dot.
3. Select a notification to go to the record it is about.
4. Select **Mark all read** to clear the badge, or **See all activity** for the full list.

How to choose what you are notified about

1. Go to **Settings › Notifications**.
2. For each kind of update (**Mentions**, **Activity assigned to me**, **Activity reminders**, **Followed-deal updates**, **Email opened**, **Email link clicked**, **Deal won**, **Deal lost**, **Comment replies**, **New email on my deals** and others), turn **In-app** and **Email** on or off.

Result: changes take effect straight away.

How to mention a teammate

1. In a note on a deal, person or organization, type `@` followed by the teammate's name.
2. Pick them from the list and save the note.

Result: they get a "You were mentioned" notification that links to the note.

How to follow a record

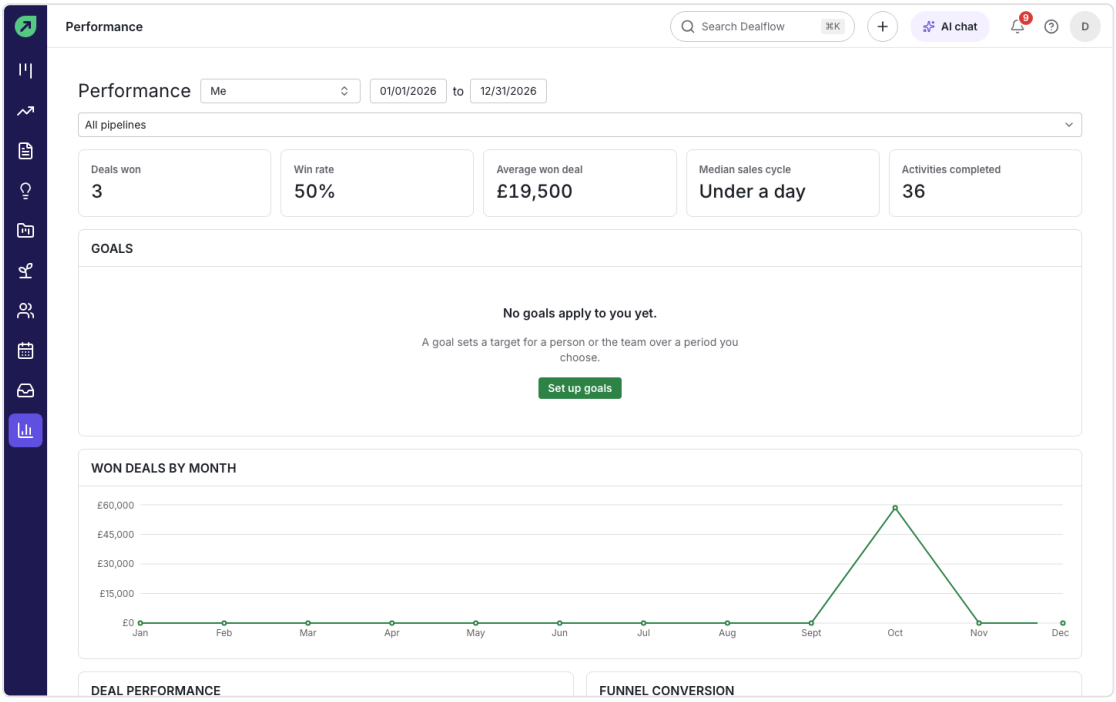

Open a deal or contact and use the follower control in the header (it shows the number of followers). Followers get updates about the record without owning it.

Stats and reporting

Dealflow has two places for numbers:

- **Performance** gives you and your team a quick view of results against goals.
- **Insights** is where you build dashboards and reports of your own.

How to check your performance

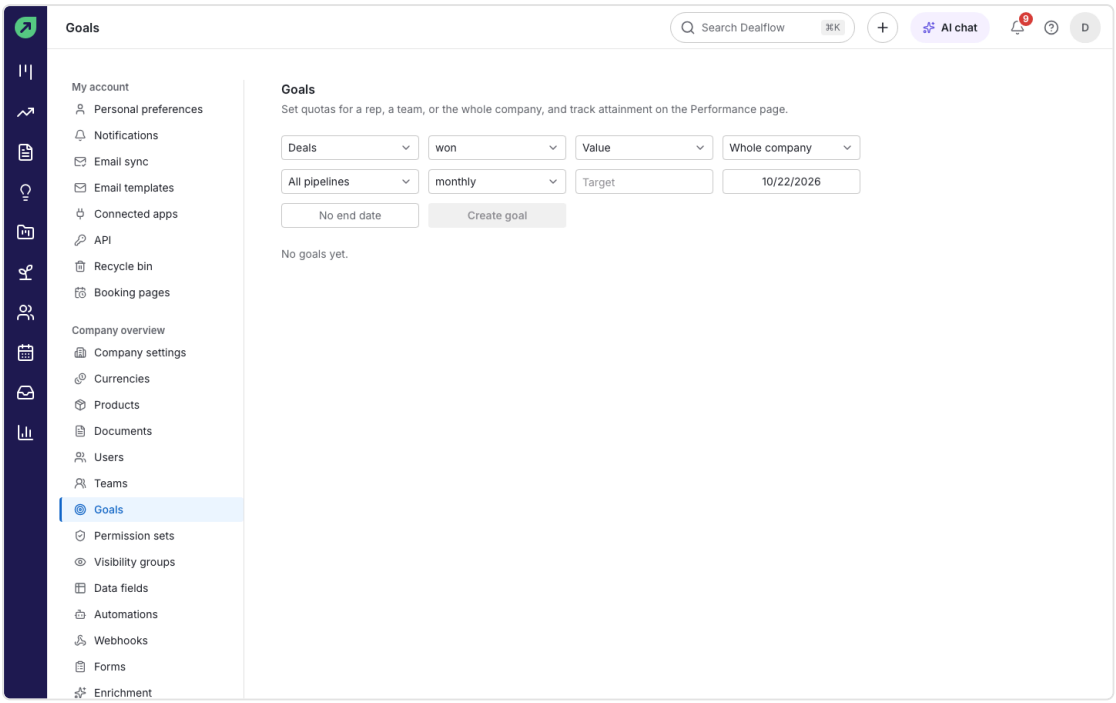

1. Select **Performance** in the left rail.
2. Choose whose numbers to see (**Me**, a teammate or a team, if you are allowed to see others), the date range and the pipeline.

Result: the cards show **Deals won**, **Win rate**, **Average won deal**, **Median sales cycle** and **Activities completed**, followed by your **Goals**, deals won by month, deal performance and funnel conversion.

How to set a goal

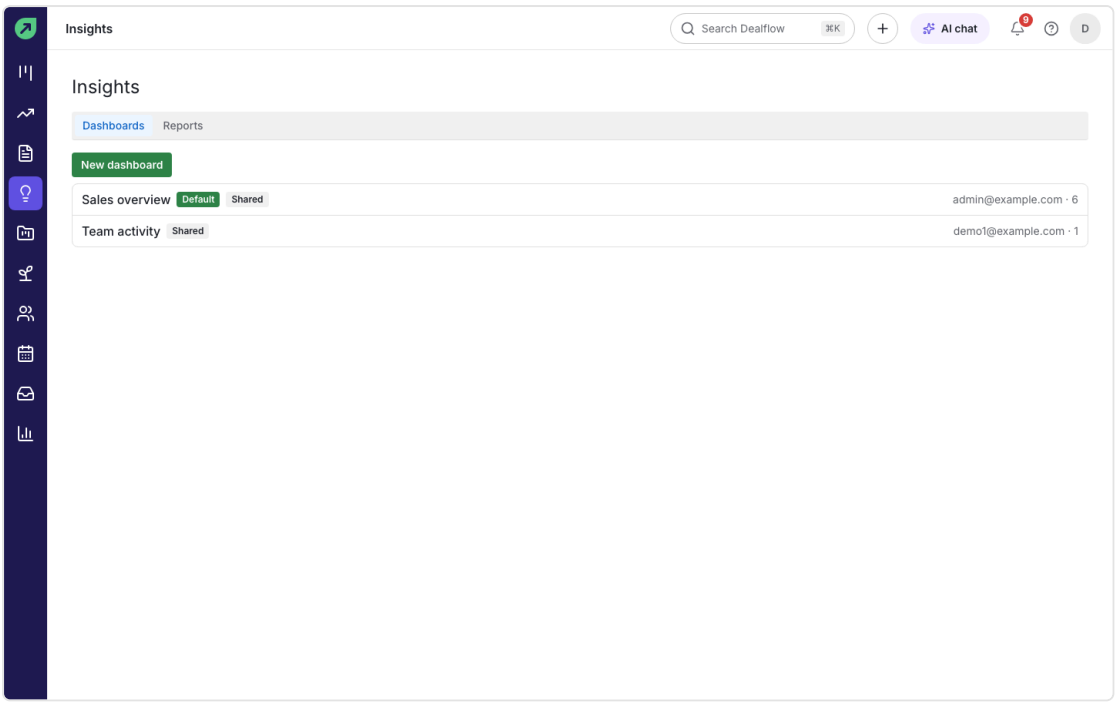

You need permission to manage goals.

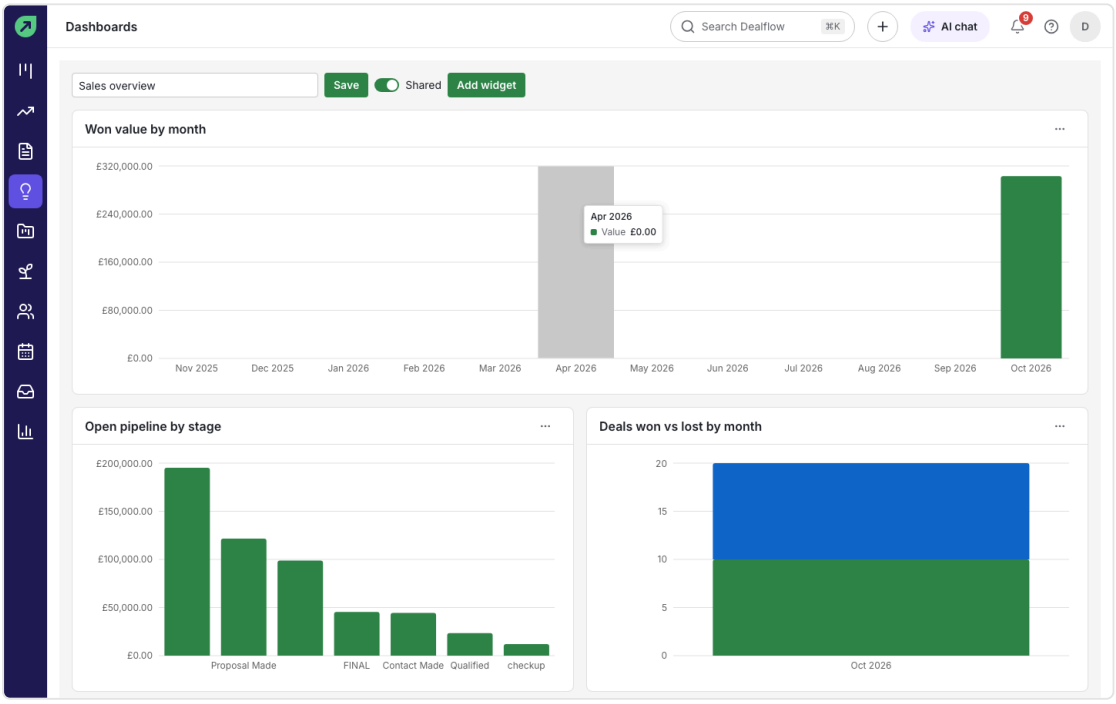

1. Go to **Settings › Goals**.
2. Choose what the goal counts: deals (added, won or lost, by value or count) or activities.
3. Choose who it is for (**Whole company**, **A team** or **One person**), the pipeline, the period (**weekly**, **monthly**, **quarterly** or **yearly**), the target, and the start and end dates.
4. Select **Create goal**.

Result: progress against the goal appears on the Performance page of everyone it applies to.

How to use dashboards

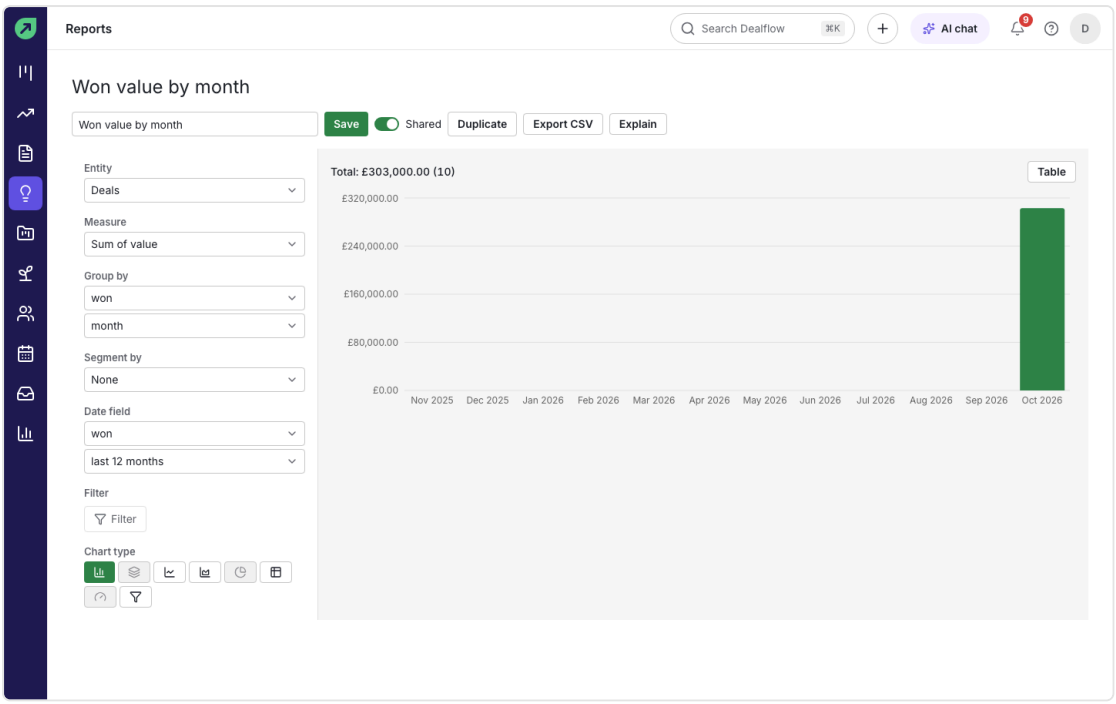

1. Select **Insights** in the left rail. **Dashboards** lists the dashboards you can see; the default dashboard is marked **Default**.
2. Select a dashboard to open it.

3. To change it, select **Add widget** to add a chart, or use a widget's menu to edit or remove it. Select **Save** when you are done.
4. Turn **Shared** on to let your colleagues see it.

Tip: select **New dashboard** on the Insights page to start an empty one.

How to build a report

1. In **Insights**, open **Reports** and select a report, or create a new one.
2. Choose the **Entity** (for example Deals), the **Measure** (for example Sum of value), what to **Group by** (for example won month) and an optional **Segment by**.
3. Choose the **Date field** and range, add a **Filter** if you need one, and pick a **Chart type**.
4. Select **Save**.

Result: the chart and its total update as you change each setting. Select **Table** to see the numbers behind the chart.

Tips:

- **Export CSV** downloads the report's data.
- **Duplicate** makes a copy you can change without affecting the original.
- **Explain** asks the AI to describe what the report shows (see AI features).

The forecast

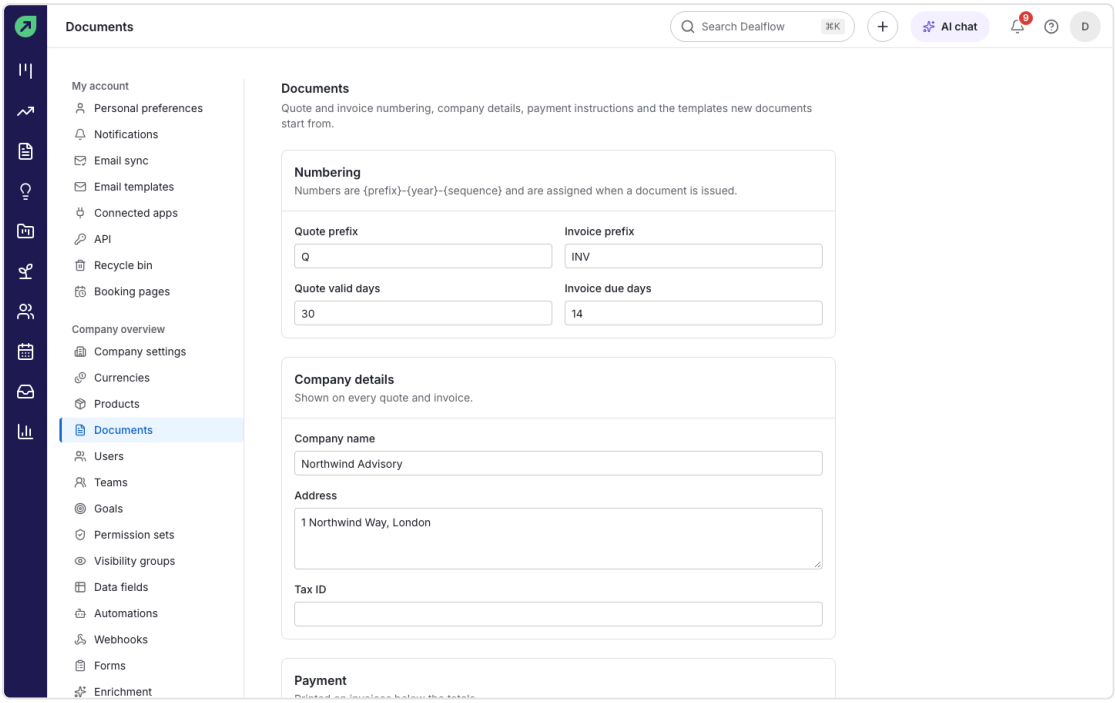

For expected revenue by month, use **Forecast** (see Pipelines and deals).

Quotes and invoices

Dealflow builds quotes and invoices from a deal's products, sends them to your customer by email with a link to a public page, and tracks them from draft to paid. You need the documents permission to create and send them.

How to set up your company details and numbering

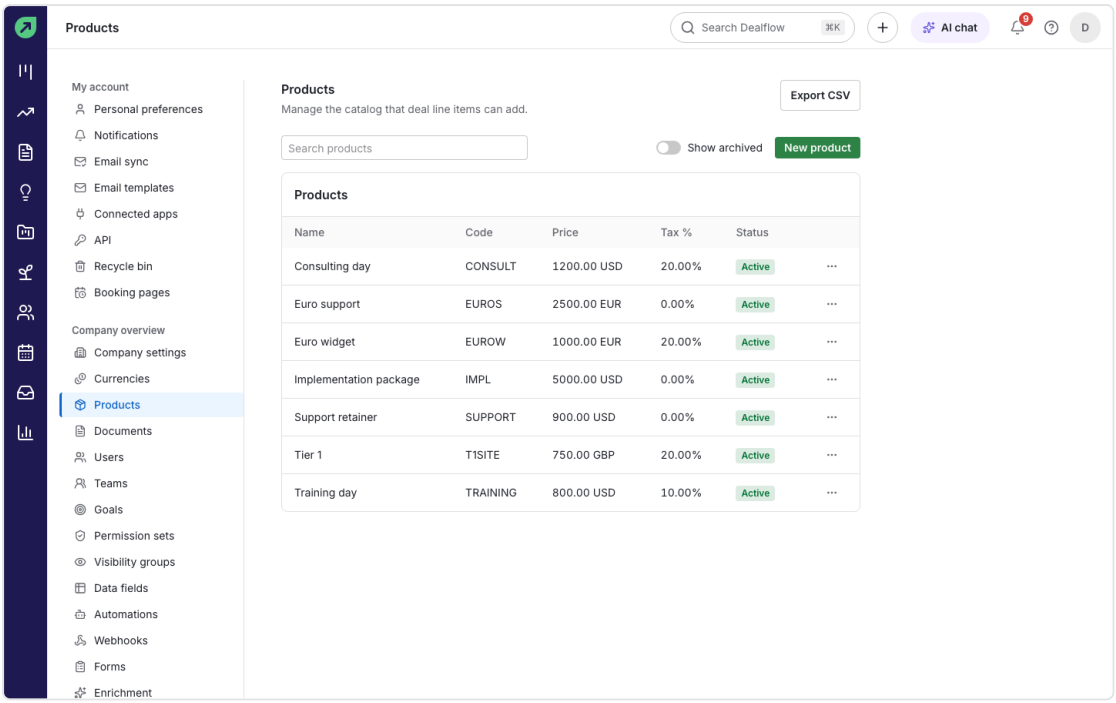

An admin does this once.

1. Go to **Settings › Documents**.
2. Under **Numbering**, set the **Quote prefix** and **Invoice prefix**, how many days a quote stays valid (**Quote valid days**) and how many days an invoice gives to pay (**Invoice due days**). Numbers look like `Q-2026-0012` and are assigned when a document is issued.
3. Under **Company details**, enter the **Company name**, **Address** and **Tax ID** printed on every document.
4. Under **Payment**, enter the **Payment instructions** printed on invoices.
5. Save.

How to manage products

You need permission to manage products.

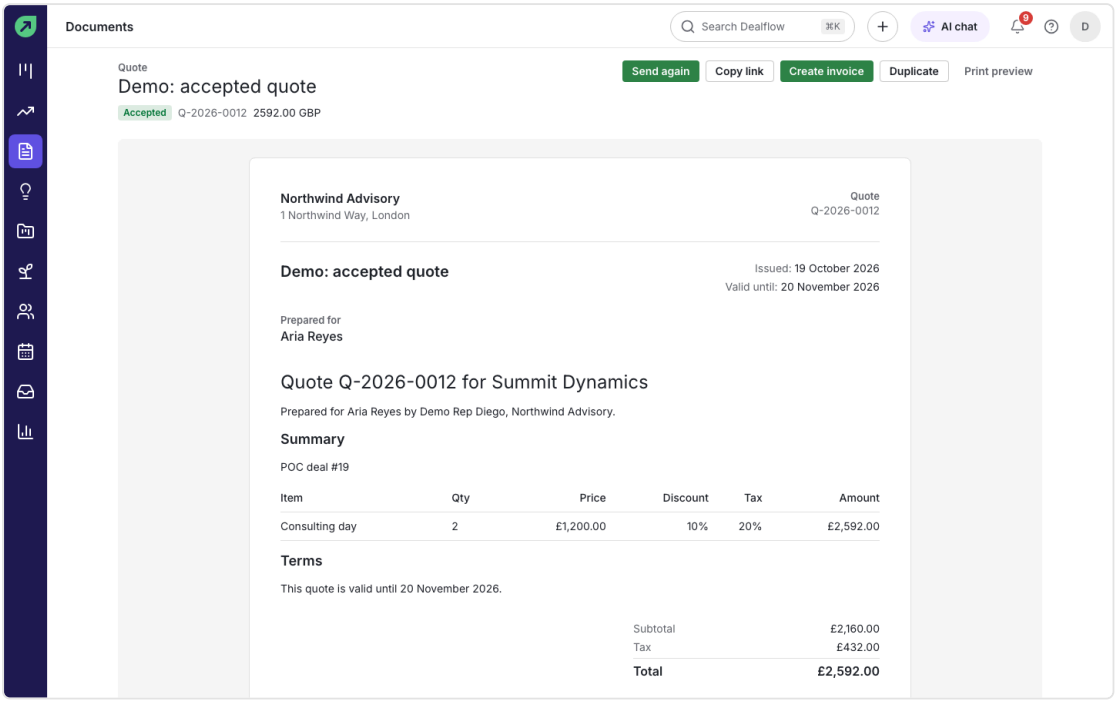

1. Go to **Settings › Products** and select **New product**.
2. Enter the **Name**, **Code**, **Price** and currency, and **Tax %**.
3. Select **Save**.

Tip: a product you no longer sell can be archived; turn on **Show archived** to see it again.

How to create a quote

1. Open the deal and add its products (see Pipelines and deals).
2. In the deal's **Documents** section, select **New quote** (or use **Create quote** in the command palette).
3. Check the **Title**, **Valid until** date, **Customer**, **Customer email** and **Customer address**, and edit the body if you need to. **Refresh from deal** pulls in the latest products.
4. Select **Save draft**.

Result: a draft quote is saved. **Print preview** shows exactly what the customer will see.

A draft's header has **Send** as the main button, then **Save draft**, **Issue**, **Mark as sent**, **Copy link** and **Print preview**. **Delete draft** is in the three-dot overflow menu.

How to send a quote

The subject and message start from your **Quote sent** email template and can be edited for this document. The email also carries a summary (number, total and valid-until date) and a **View quote** button that opens the public page. Change the template under **Settings › Email design › Templates**.

1. Open the draft quote.
2. Select **Send**.

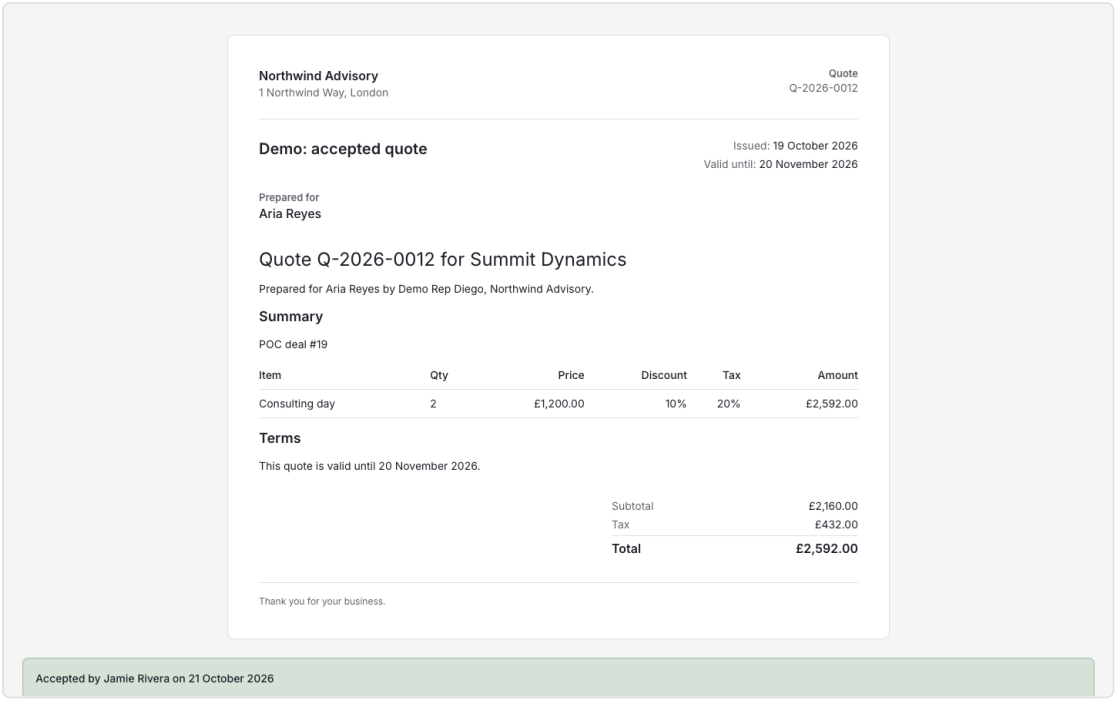

Result: the quote is issued (it gets its number), and your customer receives an email with a link to it. The status changes to **Sent**, then **Viewed** when they open it.

Tips:

- **Issue** gives the quote a number without emailing it, and **Mark as sent** records a quote you sent some other way. **Copy link** copies the customer link so you can share it yourself.
- **Send again** resends a quote that has already gone out.
- You get a notification when the customer views, accepts or declines.
- After its **Valid until** date a quote can no longer be accepted. Duplicate it to send a fresh one.

- A draft you no longer need can be removed with **Delete draft** in the header's overflow menu. Issued documents are never deleted.

What your customer sees

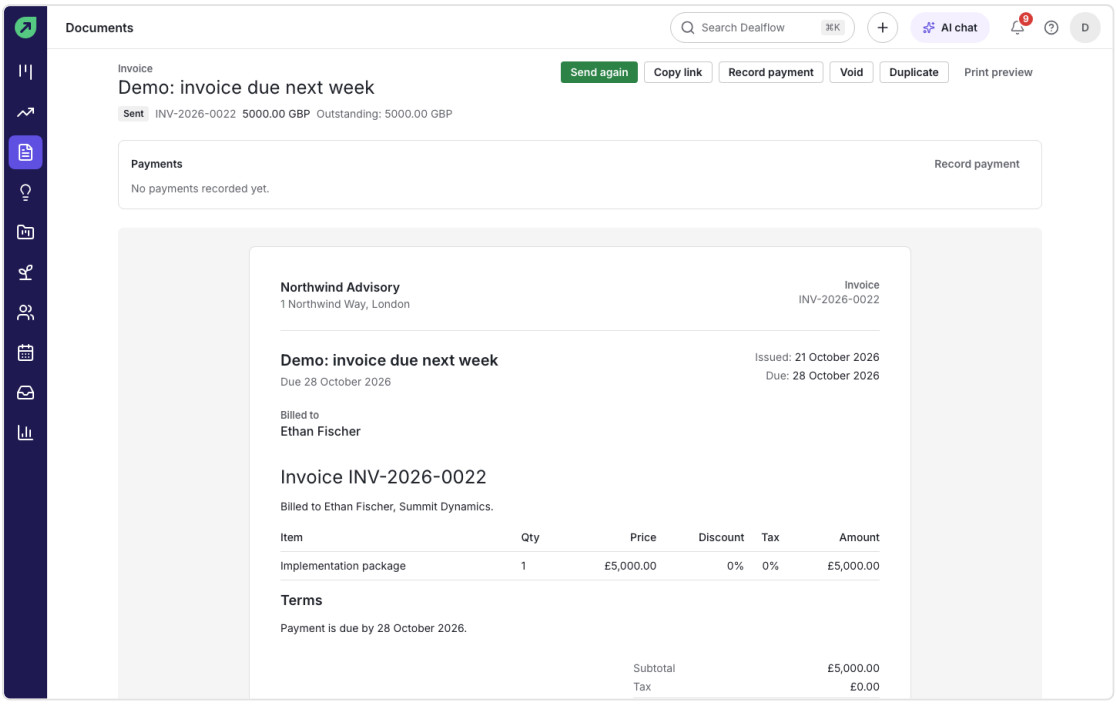

Your customer opens the link without signing in. They can read the quote, select **Download PDF**, and either type their full name and select **Accept quote**, or select **Decline**. An accepted quote shows who accepted it and when.

How to create an invoice

1. Open an accepted quote and select **Create invoice**, or in the deal's **Documents** section select **New invoice**.
2. Check the details and select **Send** (or **Save draft** to finish later).

Result: the invoice is numbered, emailed to the customer, and shown with its due date.

How to record a payment

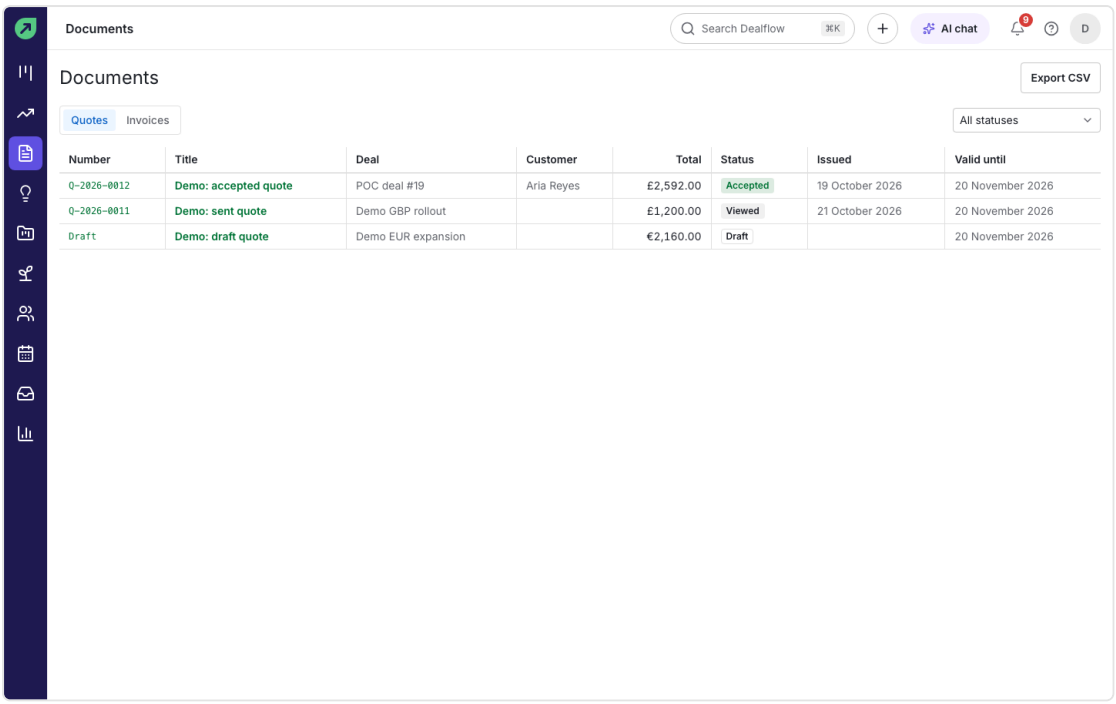

1. Open the invoice.
2. Select **Record payment**, enter the amount and date, and save.

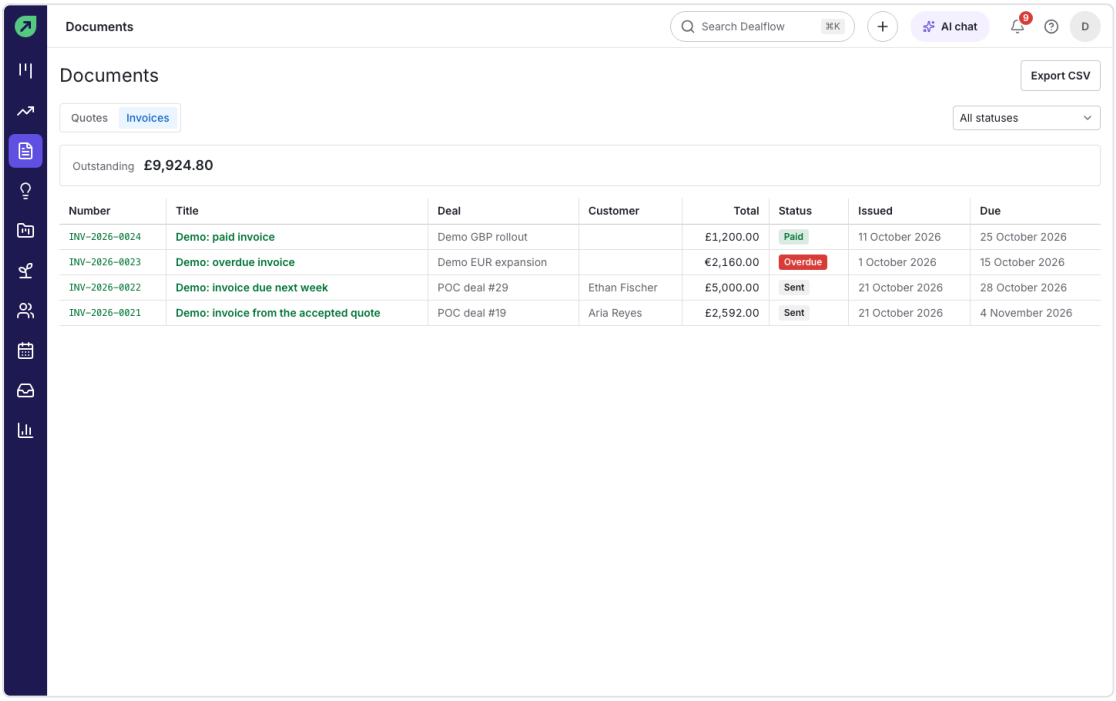

Result: the payment is listed under **Payments** and the outstanding amount goes down. When it reaches zero the invoice is marked **Paid**.

Tips:

- Invoices past their due date are marked **Overdue** automatically.
- **Void** cancels an invoice you sent by mistake. Its number is not reused.
- **Duplicate** makes a copy of any quote or invoice. On an issued document the header shows **Send again**, **Copy link**, **Duplicate** and **Print preview**, plus **Create invoice** on an accepted quote and **Record payment** on an invoice; **Void** is in the overflow menu.

How to see all your documents

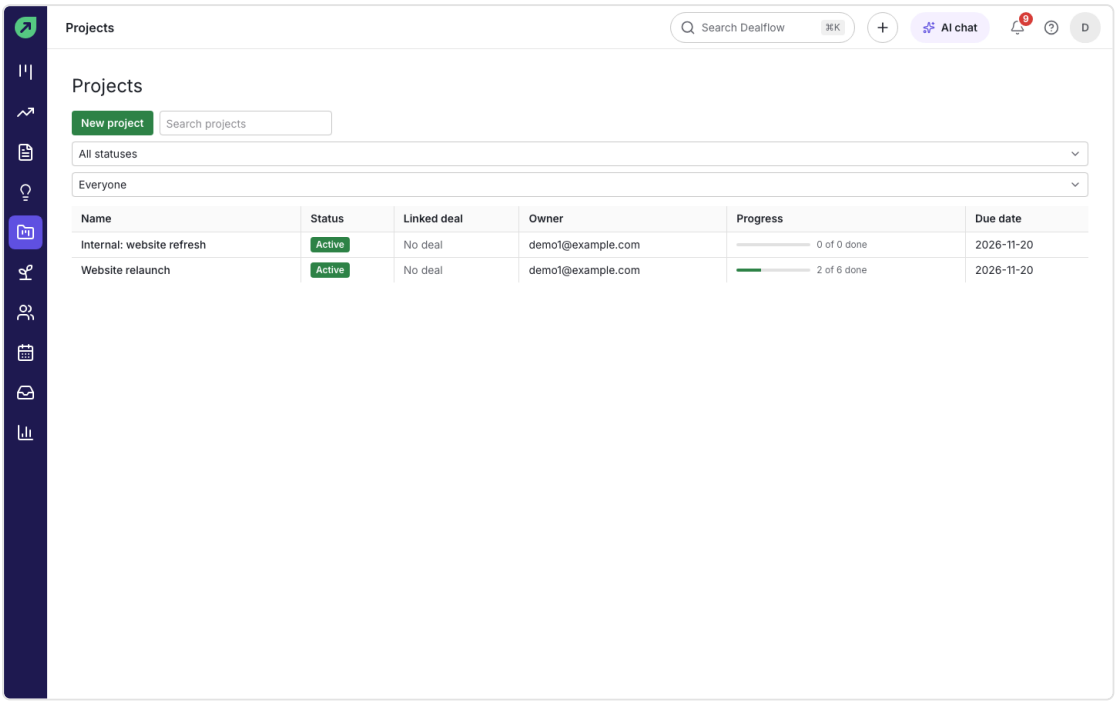

1. Select **Documents** in the left rail.
2. Switch between **Quotes** and **Invoices**, and filter by status.

Result: the list shows each document's number, title, deal, customer, total, status and dates. The invoices tab also shows the total outstanding. **Export CSV** downloads the list.

Projects

Projects track the work that follows a won deal, such as onboarding or delivery. A project has phases (for example Kickoff, Delivery and Wrap-up), and each phase holds tasks.

How to see your projects

1. Select **Projects** in the left rail.
2. Filter by status and owner, or search by name.

Result: each project shows its status, linked deal, owner, progress (tasks done out of the total) and due date.

How to create a project

1. In **Projects**, select **New project**.
2. Enter a **Name**, and optionally choose a **Linked deal**, the **Owner**, a **Start date** and a **Due date**.
3. Name the **Phases** the project moves through. Use **Add phase** for more, or **Remove** to drop one.
4. Select **Create project**.

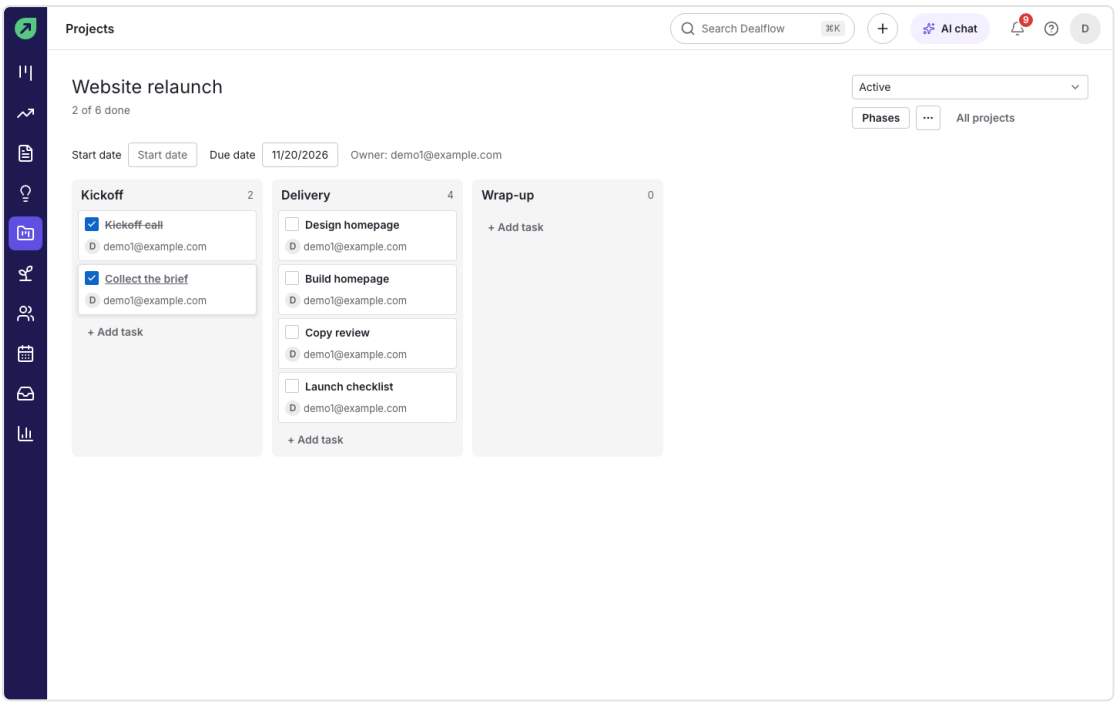

Result: the project opens with one column per phase.

How to start a project from a won deal

1. Open the won deal.
2. In the **Projects** section of the left column, select **Create project**.

Result: a project named after the deal is created and linked to the deal, its person and organization, with the deal owner as project owner.

How to add and complete tasks

1. Open the project.
2. Under a phase, select **+ Add task**, type the task and press `Enter`.
3. Tick a task's box when it is done.

Result: the progress bar and the "x of y done" count update.

Tips:

- Set the project's status (for example **Active**) at the top right.
- Linked projects also appear in the deal's **Projects** section.
- An admin can create an automation that starts a project when a deal is won (see Admin).

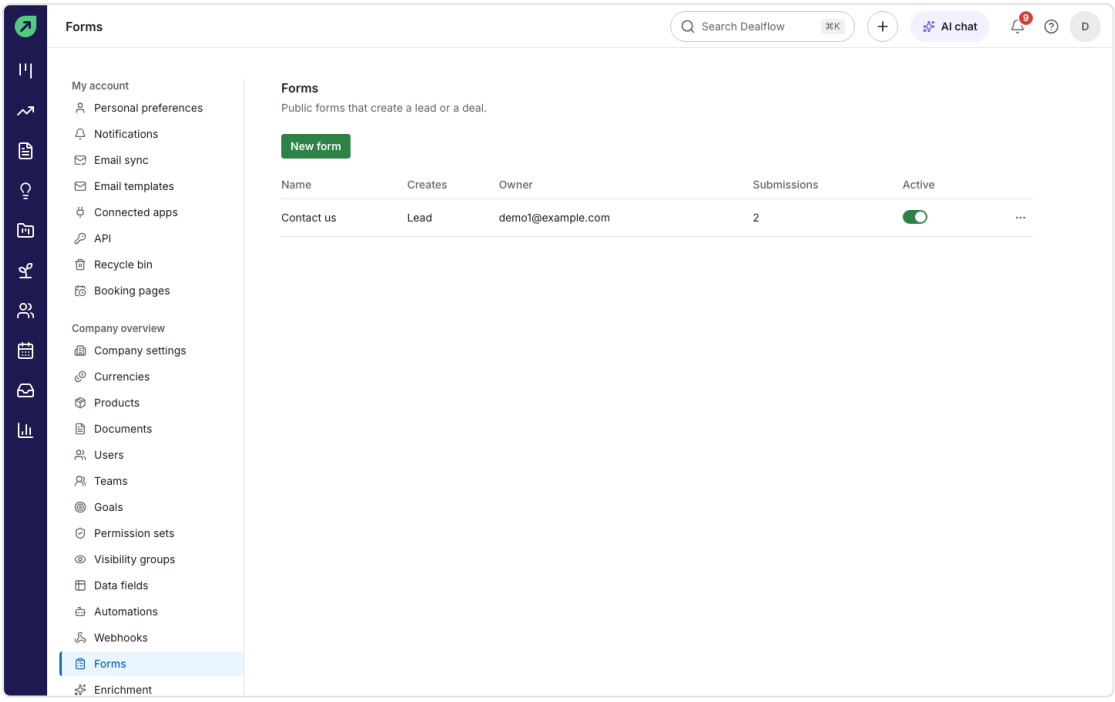

Forms and booking pages

Web forms and booking pages are public pages that people outside your company can use without signing in.

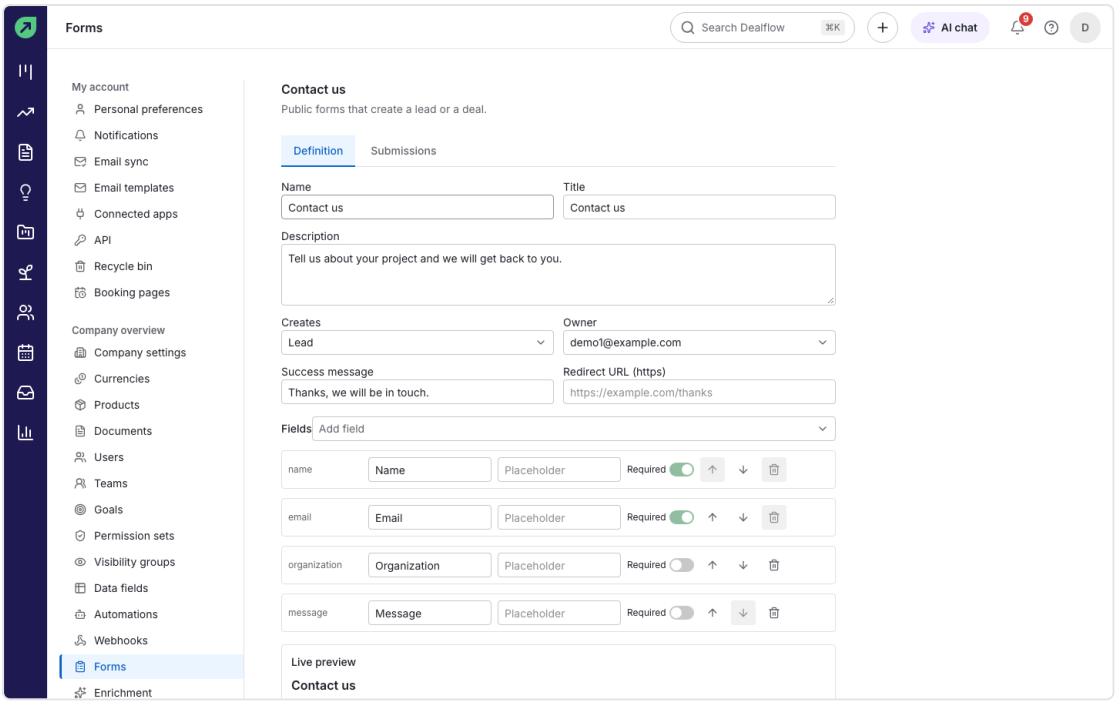

Web forms

A web form collects enquiries from your website and creates a lead or a deal for each submission. You need permission to manage forms.

How to create a form

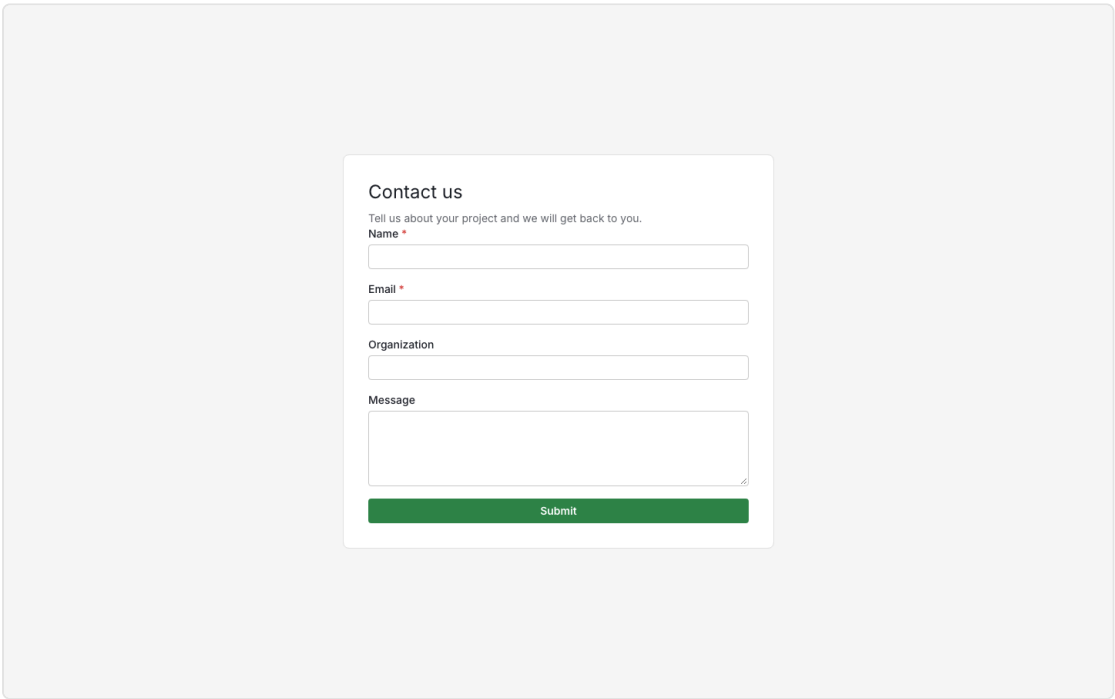

1. Go to **Settings › Forms** and select **New form**.
2. On the **Definition** tab, set the **Name**, the **Title** and **Description** visitors see, what the form **Creates** (**Lead** or **Deal**), and the **Owner** of what it creates.
3. Under **Fields**, use **Add field** to add fields such as name, email, organization, phone and message. Set each field's label and placeholder, and whether it is **Required**.
4. Set the **Success message** visitors see after submitting, or a **Redirect URL** to send them to your own thank-you page.
5. Save, and make sure the form is **Active**.

Result: the form gets a public link, and the **Live preview** shows what visitors will see.

How to put a form on your website

Copy the form's public link from the forms list and link to it from your website, or embed it using the code the form editor gives you. The form also works when the visitor's browser has JavaScript turned off.

What happens when someone submits

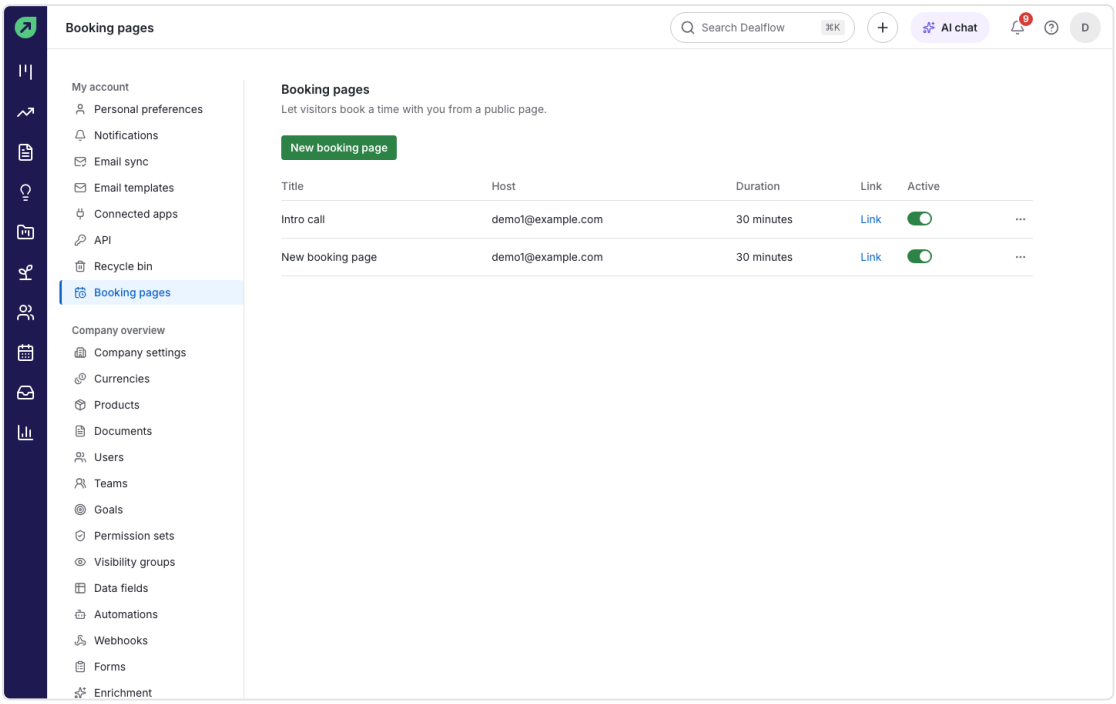

1. A lead (or deal) is created with the submitted details, and its source is set to the form.
2. The form's owner gets a "New form submission" notification.
3. The submission is listed on the form's **Submissions** tab.

Tip: forms include spam protection, so you do not need to add a captcha.

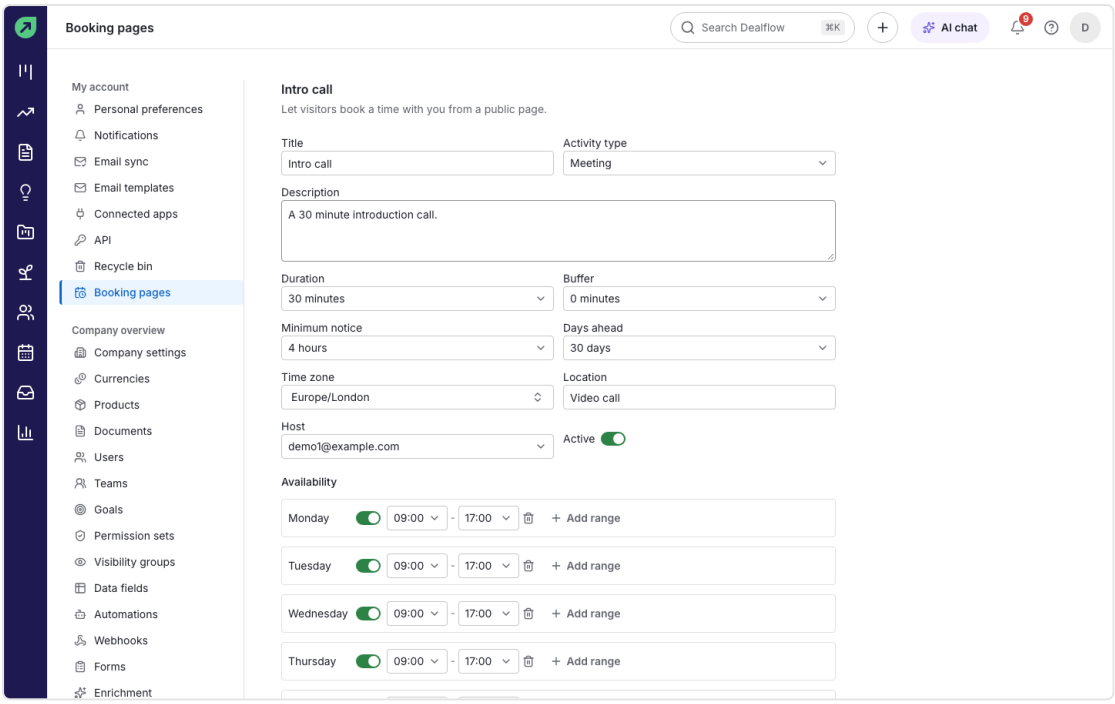

Booking pages

A booking page lets someone pick a time to meet you. The booking goes straight into your activities.

How to create a booking page

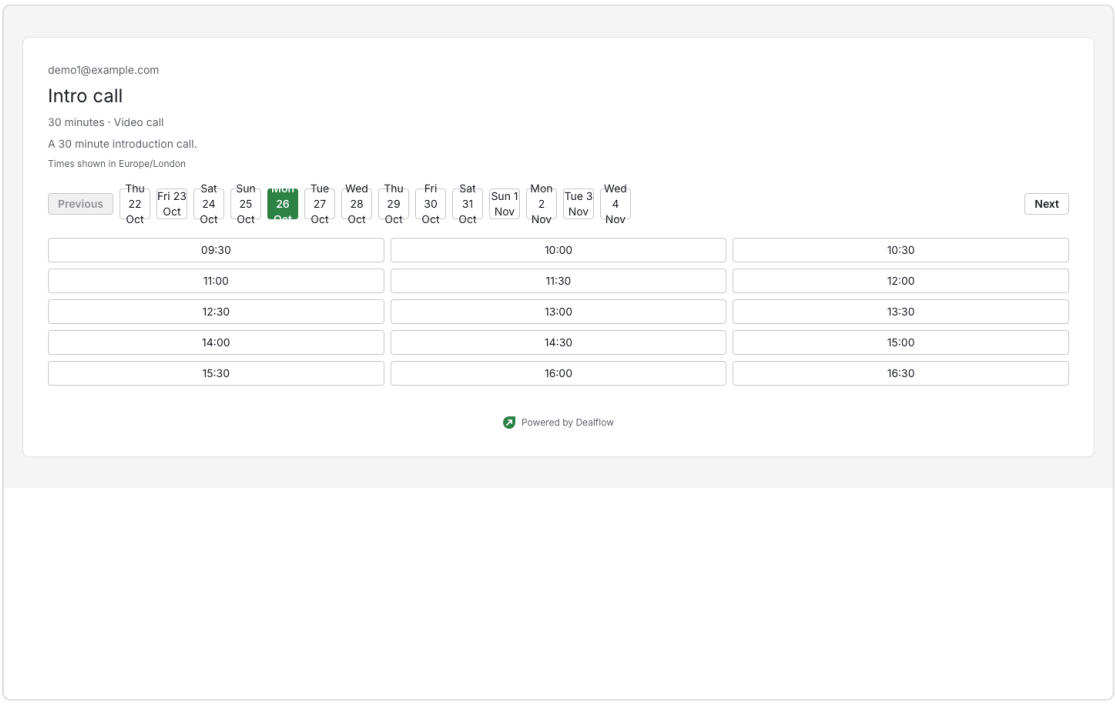

1. Go to **Settings › Booking pages** and select **New booking page**.
2. Set the **Title**, **Description**, **Activity type** (for example Meeting), **Duration** and **Location** (for example Video call).
3. Set the **Buffer** between meetings, the **Minimum notice** before a booking, how many **Days ahead** people can book, and your **Time zone**.
4. Under **Availability**, turn on each weekday you are available and set the hours. **Add range** adds a second block on the same day.
5. Turn on **Active** and save.

Result: the page appears in the list with its public **Link**.

What your visitor sees

1. The visitor opens the link and picks a day. Times are shown in your booking page's time zone.
2. They pick a time, enter their details and confirm.

Result: they get a confirmation email with a link to cancel, and an activity is added to your calendar. If they cancel, the activity is removed and you are told.

Tip: times already taken by your other activities are not offered.

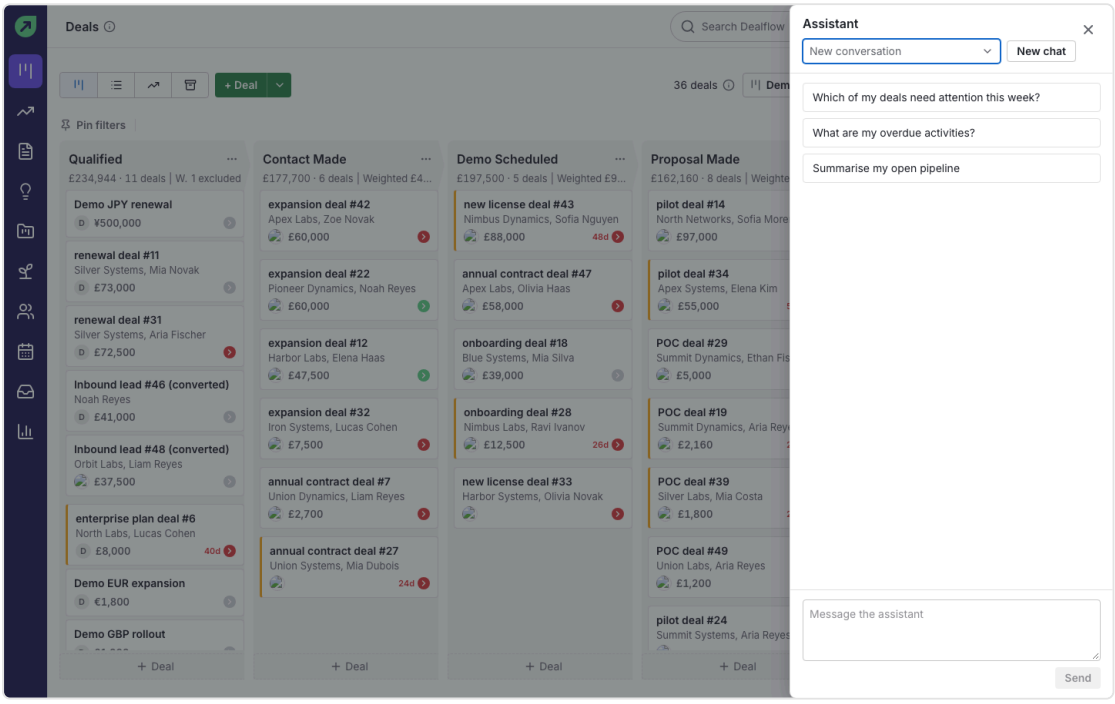

AI features

Dealflow has AI built in. It can summarise a deal, score how likely it is to close, draft emails, turn meeting notes into activities, build filters from plain English, explain reports and answer questions in a chat. An admin can turn AI off or set monthly limits (see Admin).

Good to know:

- The AI sees only the records you can see.
- It never changes anything without asking you first.
- Everything it suggests is a draft: check it before you rely on it.

How to ask the assistant

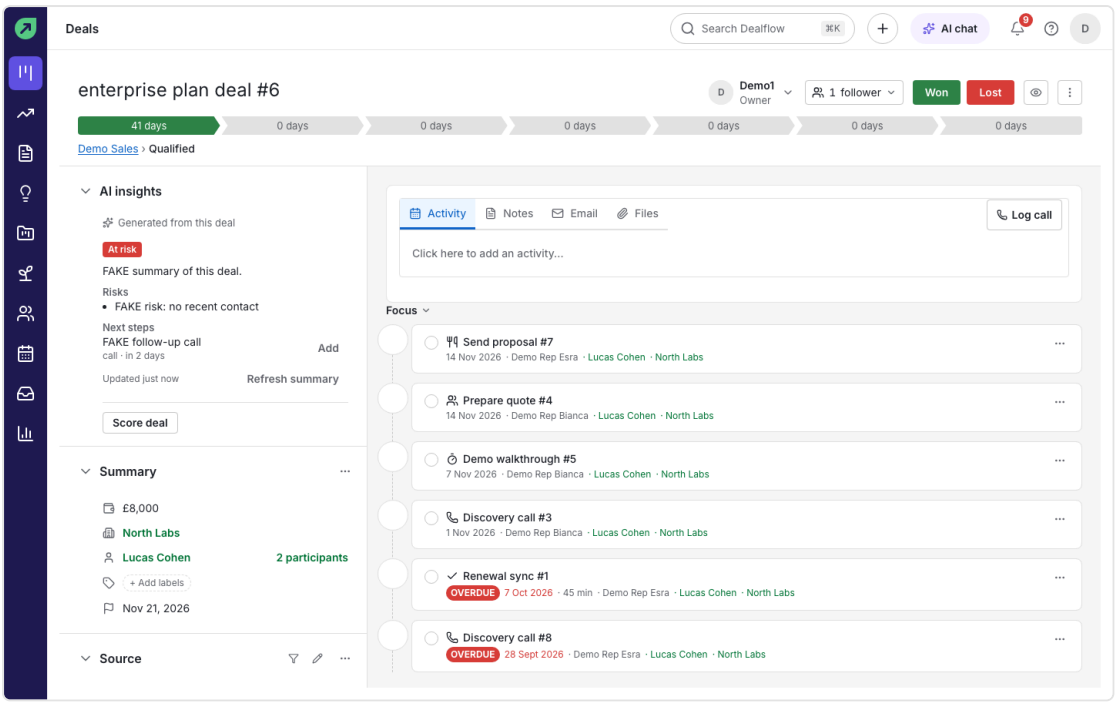

1. Select **AI chat** in the top bar.
2. Pick a suggested question (for example "Which of my deals need attention this week?") or type your own in **Message the assistant**.
3. Select **Send**.

Result: the assistant answers using your Dealflow data. If it wants to make a change, such as adding a note or an activity, it shows the change with **Confirm** and **Reject** buttons and does nothing until you confirm.

Tips:

- **New chat** starts a fresh conversation. Earlier conversations are kept in the list at the top.
- Press `Escape` to close the panel.

How to summarise a deal

1. Open the deal.
2. In **AI insights**, select **Generate summary**.

Result: a short summary of the deal, its **Risks** and suggested **Next steps** appear. Select **Add** next to a next step to turn it into an activity. **Refresh summary** updates it after the deal changes.

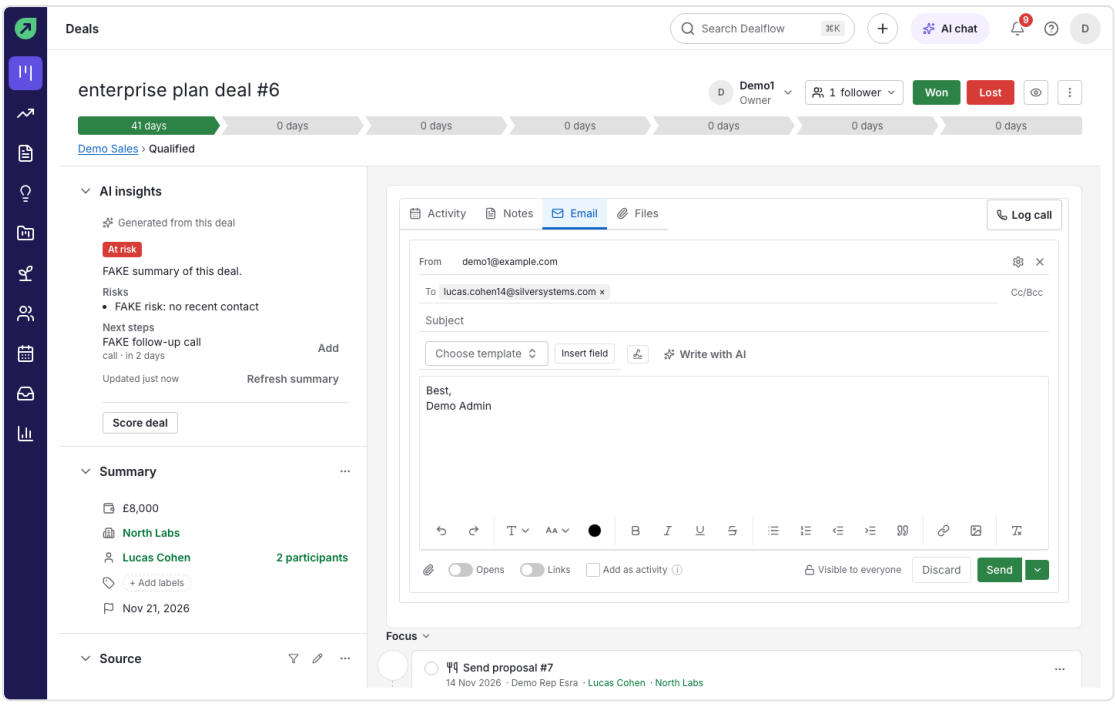

How to score a deal

1. Open the deal.
2. In **AI insights**, select **Score deal**.

Result: a score badge appears on the deal showing how likely it is to close.

Tip: to score many deals at once, switch the board to **List view**, tick the deals and select **Score with AI**. You get a notification when scoring finishes.

How to draft an email with AI

1. Start a new email from a deal, contact or the inbox.
2. Select **Write with AI** and, in **What should the email say?**, describe it, for example "Thank them for the call and send the pricing we discussed".
3. Select **Draft**.

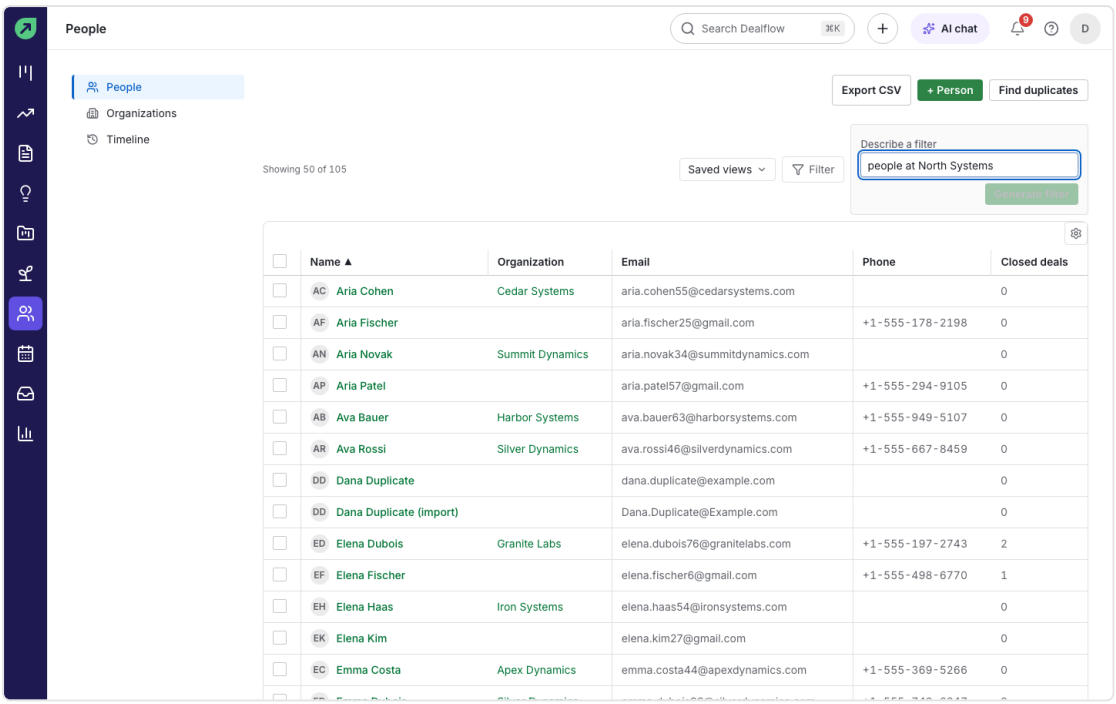

Result: the subject and body are filled in. Edit them as you like, then send, or select **Discard** to throw the draft away.

How to turn notes into activities

1. On a deal, add a note (for example "Call went well, send pricing Friday") and save it.
2. Open the note's **More actions** menu and choose **Turn into activities**.
3. In **Suggested activities**, check or change each suggestion and select **Create selected**.

Result: the activities are created and linked to the deal.

How to build a filter in plain English

1. In **Leads**, **People** or **Organizations**, select **Ask AI** in the toolbar, type what you want in **Describe a filter** (for example "people at North Systems") and select **Generate filter**.
2. On the pipeline, select **Filter** then **Create new filter**: the same **Describe a filter** box sits inside that dialog, above **Generate filter**.

Result: Dealflow turns your sentence into filter conditions and applies them. Open **Filter** to see or adjust the conditions it chose.

How to get a report explained

1. Open a report in **Insights**.
2. Select **Explain**.

Result: a short written explanation of what the chart shows, such as trends and the biggest contributors.

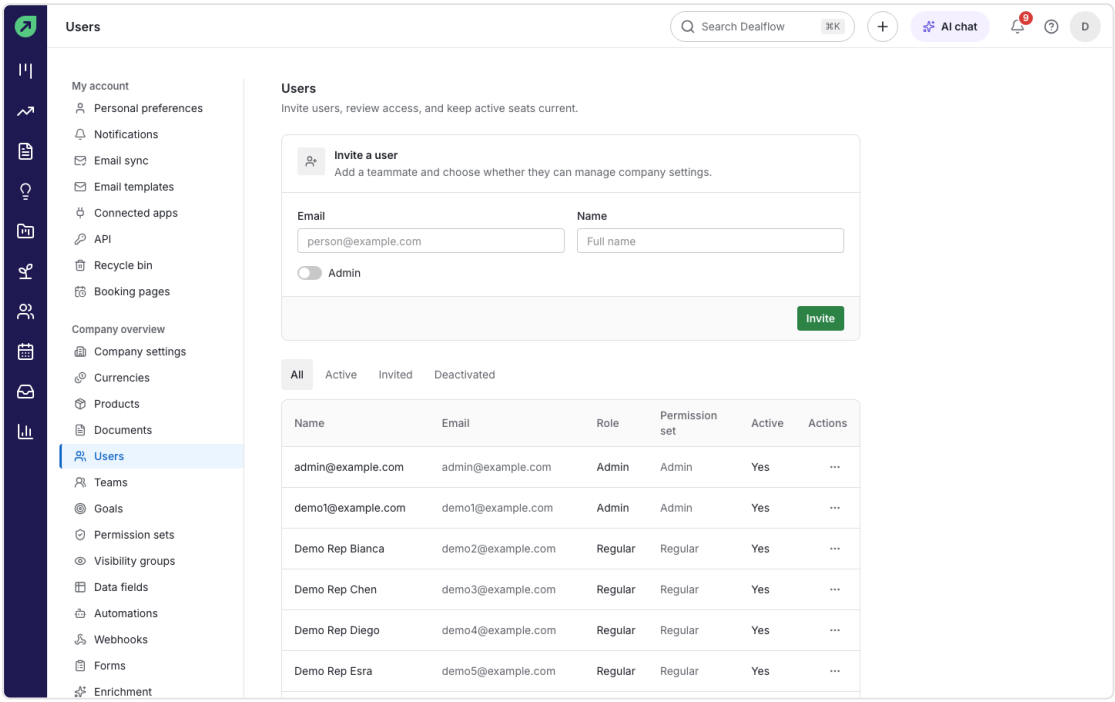

How to automate with AI

Admins can describe an automation in a sentence and let Dealflow draft it, and automations can include AI steps. See Admin.

Admin

This section is for admins: the people who set Dealflow up for the company. Most of these pages are under **Settings** (open the **Account menu** and choose **Settings**). The settings menu has two parts: **My account** (your own preferences, which every user has) and **Company overview** (company-wide settings, shown only to users with the right permissions). The menu stays in place while the page beside it scrolls.

How to invite a user

1. Go to **Settings › Users**.
2. Under **Invite a user**, type their **Email** and **Name**. Turn on **Admin** only if they should manage company settings.
3. Select **Invite**.

Result: they receive an invite email with a link to set their password, and appear under **Invited** until they accept.

Tips:

- Use the row's menu in the list to change a user's permission set or to deactivate them. A deactivated user cannot sign in, but their records stay.
- The filters above the list show **All**, **Active**, **Invited** or **Deactivated** users.

How to brand the emails Dealflow sends

Dealflow sends two kinds of email: product email to your team (sign-in links, invites, notifications, backup and webhook warnings) and customer email from your company. Both go through one design.

1. Go to **Settings › Email design**, then the **Branding** tab.

2. Select **Upload logo** and choose a PNG or JPEG up to 256 KB. A wide logo on a transparent or white background works best.
3. Set the **Display name**, the **Accent colour** (buttons and links; the editor refuses a colour whose white button text would be hard to read), whether to show your company address, optional footer text, and whether to show "Powered by Dealflow".
4. Choose the **New emails** and **Replies** layouts. **Branded** puts the message in your card, **Minimal** keeps a reply plain, and **Plain** sends what the author wrote without a layout.
5. Select **Save**, then **Send test to me** to check the result in your own inbox. The preview on the right updates as you edit.

How to edit an email template

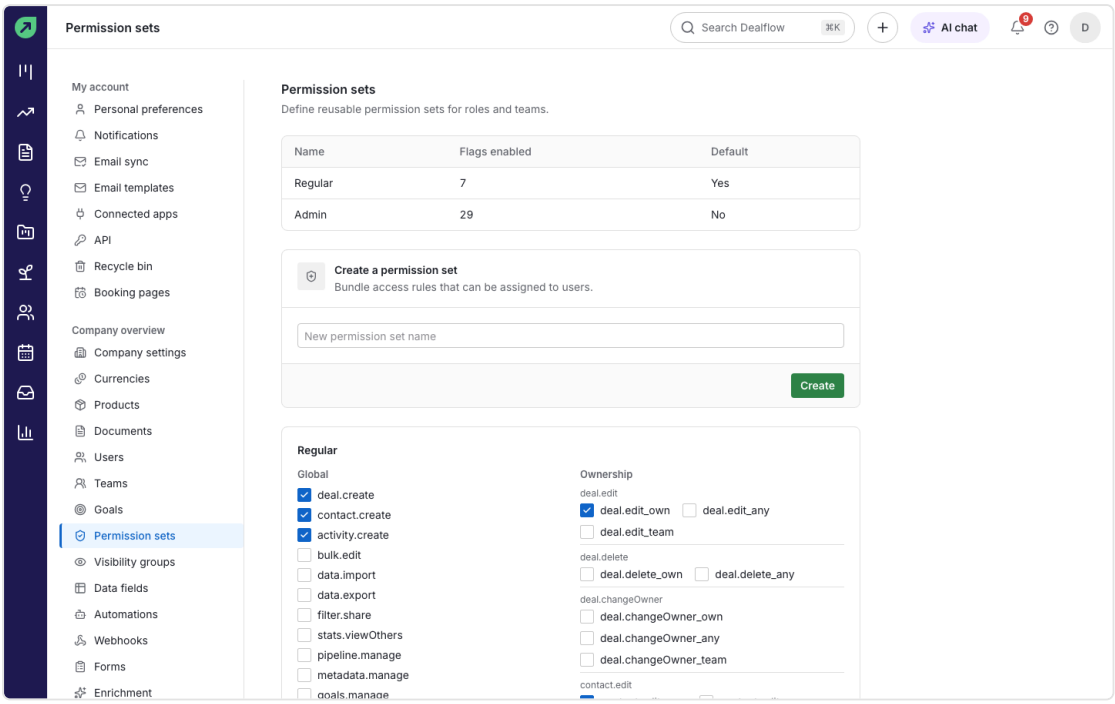

1. Go to **Settings › Email design**, then the **Templates** tab.
2. Select **Edit** on the email you want to change.
3. Edit the **Subject**, **Preview line** and **Body**. Select **Insert variable** to place a value such as the recipient's name, a document total or a sign-in link. The button label is editable; the link itself always comes from Dealflow.
4. Select **Save template**. Select **Send test to me** to see it, or **Reset to default** to restore the original copy.

Tips:

- Template changes apply to email sent after you save. Already-sent mail does not change.
- Product emails keep the Dealflow mark and the "Sent by Dealflow for {company}" footer. Customer emails use your logo, colours and footer.
- The quote and invoice dialogs start with the template's subject and message, and you can edit them per document.

How to control what people can do

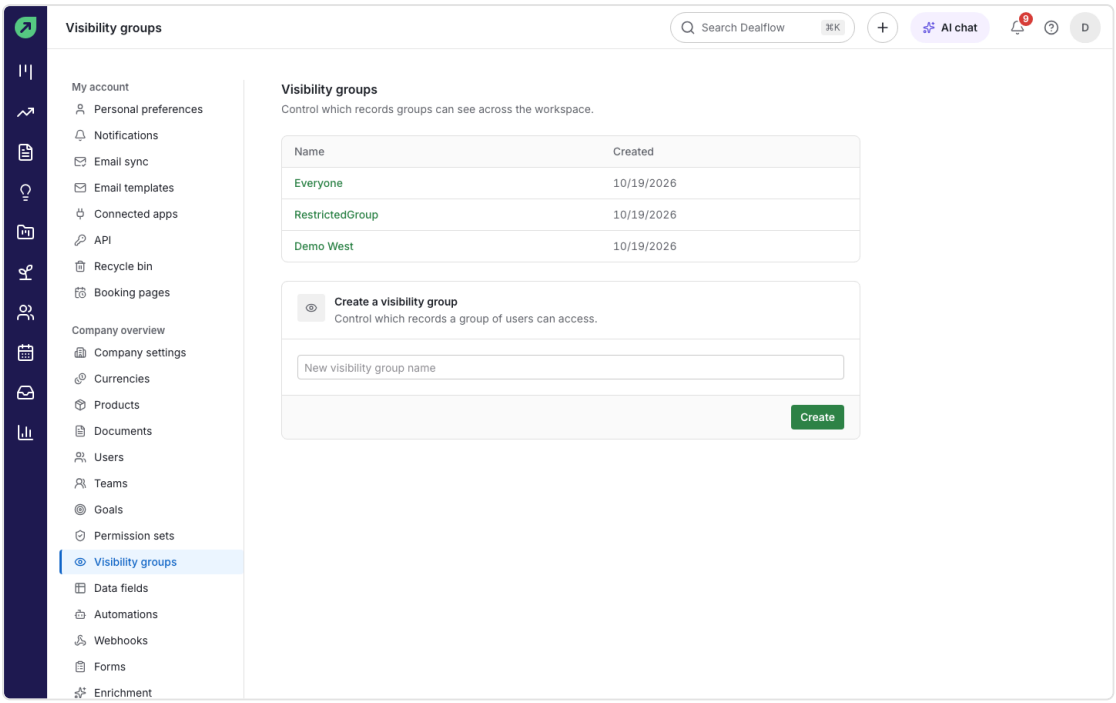

Permission sets decide what users can do. Dealflow comes with **Regular** (create deals, contacts and activities, and edit their own) and **Admin** (everything).

1. Go to **Settings › Permission sets**.
2. To make a new set, type a name under **Create a permission set** and select **Create**.
3. Tick the permissions the set should have. Examples: `data.import`, `data.export`, `bulk.edit`, `pipeline.manage`, `products.manage`, `documents.manage`, `automations.manage`, `forms.manage`, `goals.manage`, and whether users can edit their own records, their team's, or anyone's.
4. Assign the set to users in **Settings › Users**.

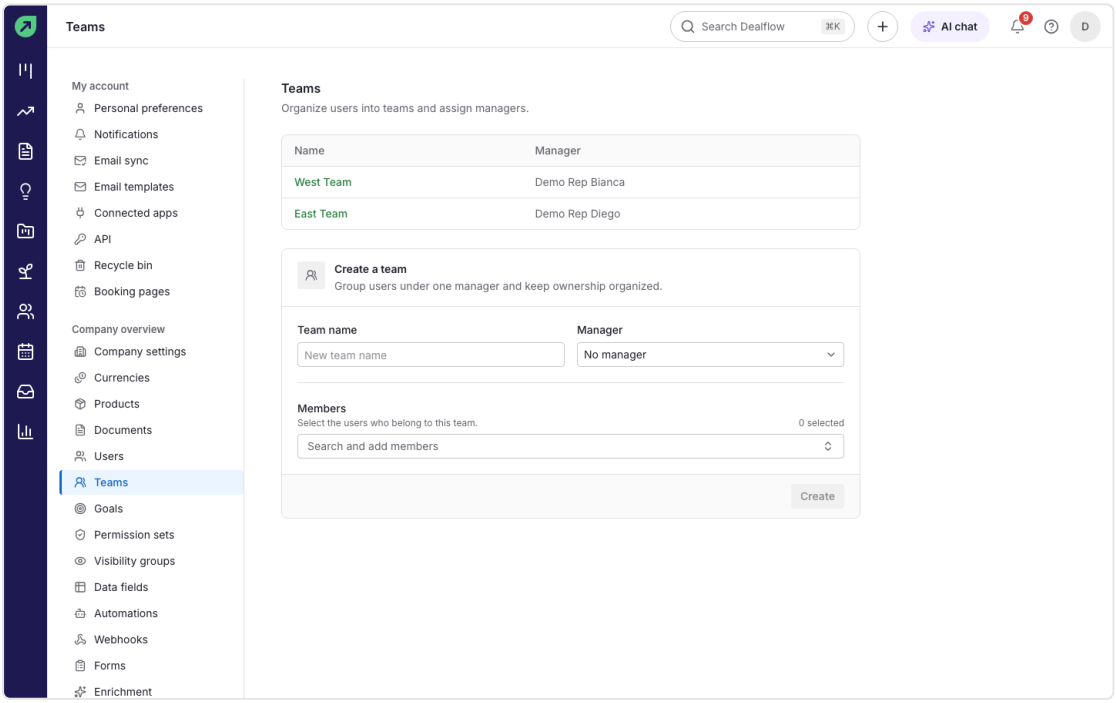

How to control what people can see

Visibility groups decide which records a group of users can see.

1. Go to **Settings › Visibility groups**.
2. Type a name under **Create a visibility group** and select **Create**.
3. Open the group to add members and choose what they can see.

How to organise users into teams

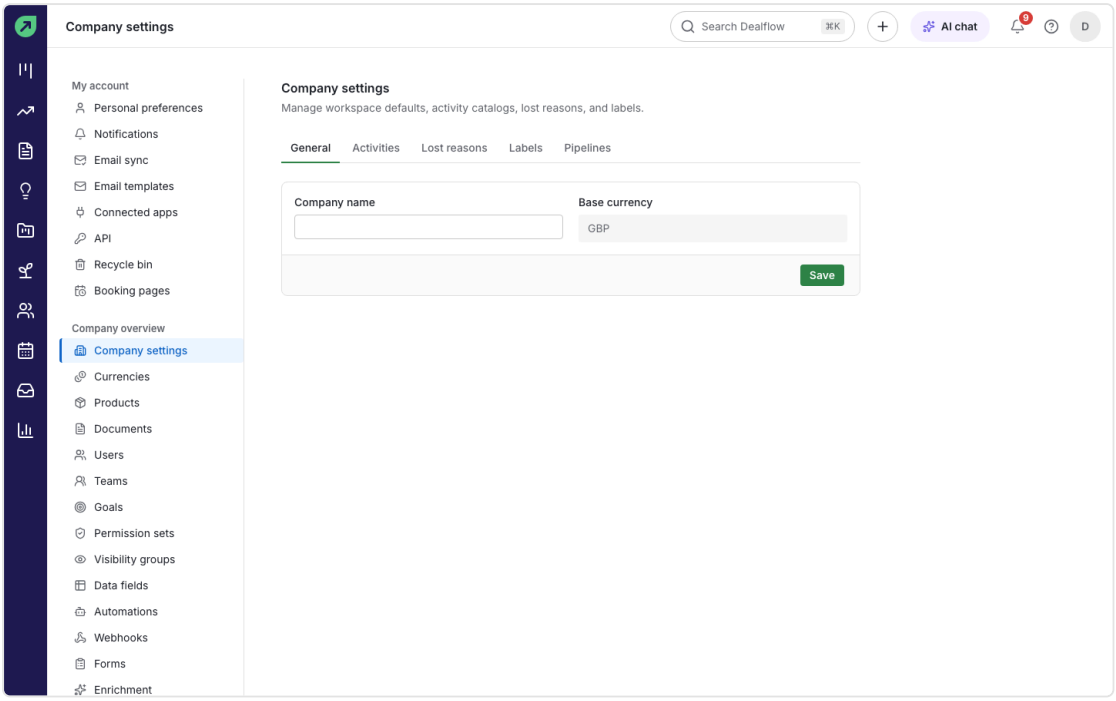

1. Go to **Settings › Teams**.
2. Under **Create a team**, enter the **Team name**, choose a **Manager**, and add **Members**.

3. Select **Create**.

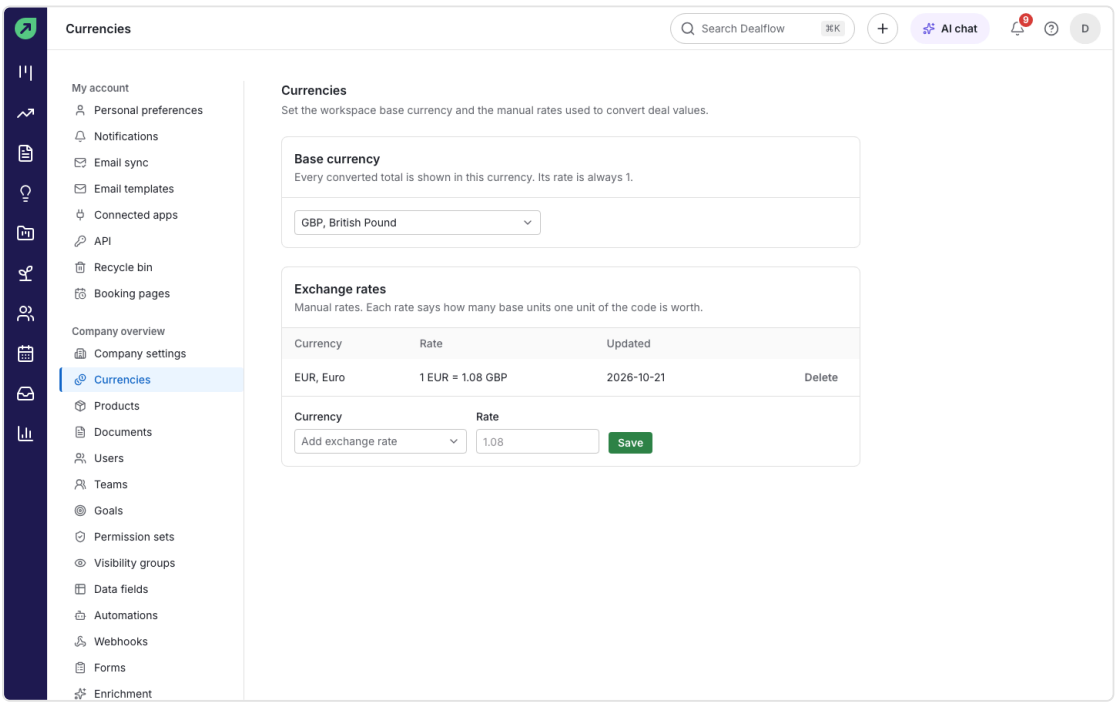

Result: teams can be used for goals, reports and filters.

How to set company-wide options

1. Go to **Settings › Company settings**.
2. On **General**, set the **Company name** and the **Base currency** every total is converted into.
3. Use the tabs to manage **Activities** (activity types), **Lost reasons**, **Labels** and **Pipelines**.

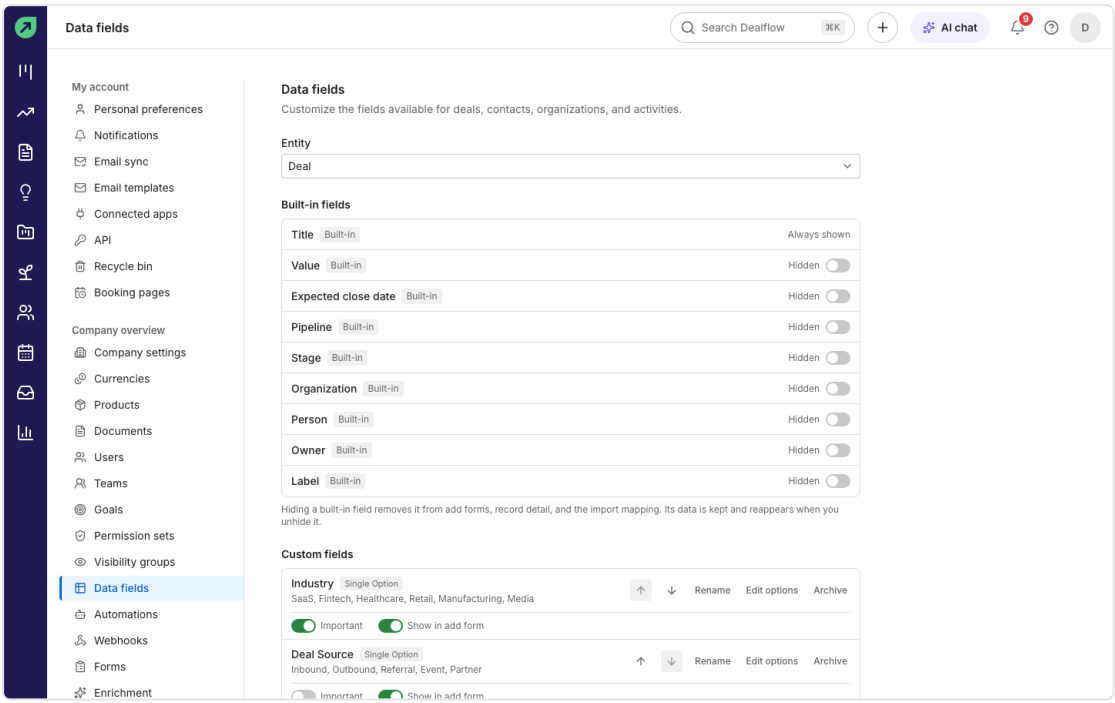

How to set exchange rates

1. Go to **Settings › Currencies**.
2. Under **Exchange rates**, choose a **Currency**, enter the **Rate** (how many units of your base currency one unit is worth, for example 1 EUR = 1.08 GBP) and select **Save**.

Tip: rates are not updated automatically. Review them when they move.

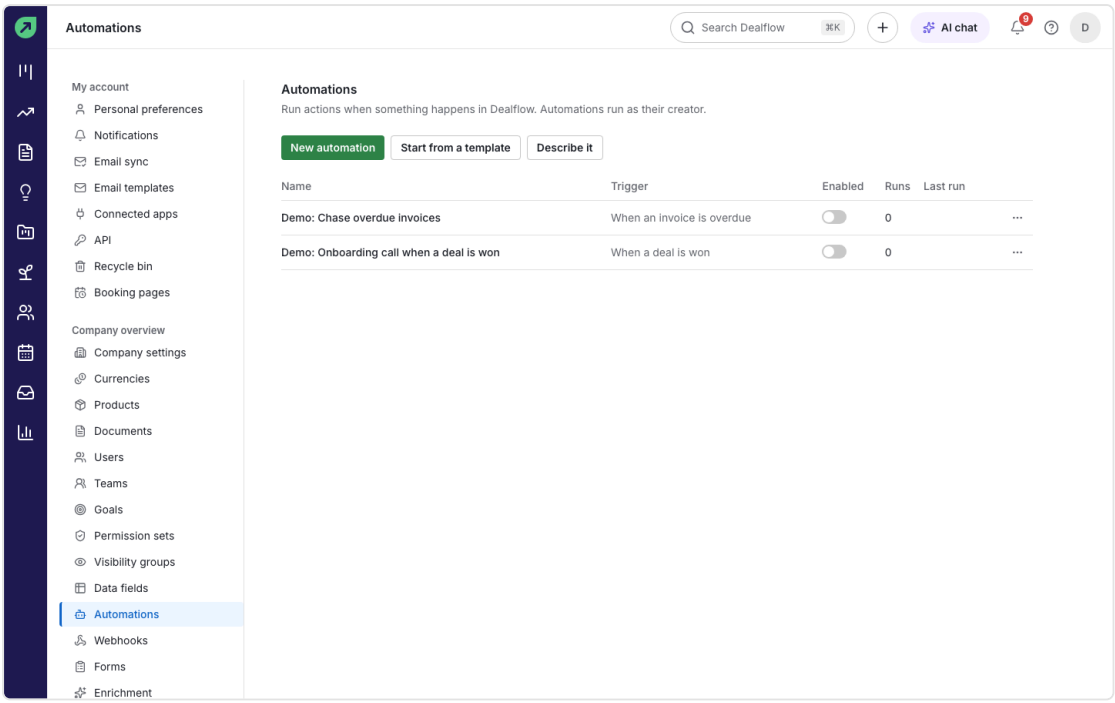

How to add custom fields

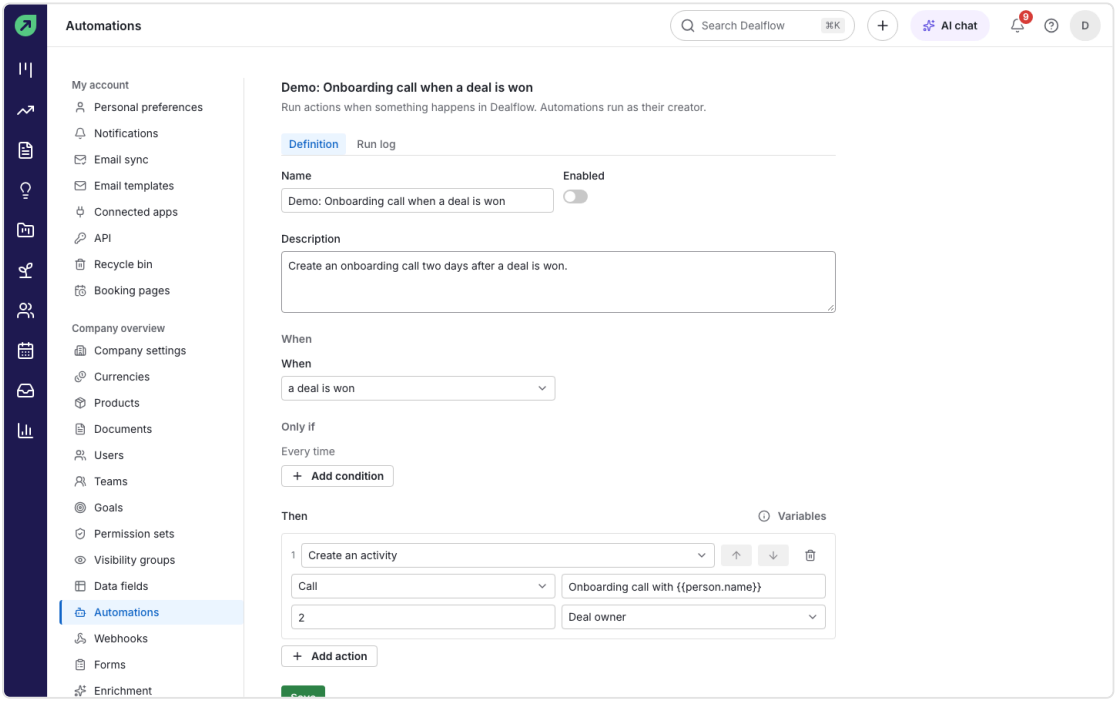

1. Go to **Settings › Data fields** and choose the **Entity**: deals, people, organizations or activities.
2. Under **Custom fields**, add a field and choose its type (for example a single option list such as Industry).
3. Choose whether it is **Important**, shown in add forms, or required.
4. To hide a built-in field you do not use, turn it off under **Built-in fields**.

How to automate routine work

You need permission to manage automations. Automations run as the user who created them.

1. Go to **Settings › Automations**.
2. Select **New automation**, **Start from a template**, or **Describe it** to type what you want in a sentence and select **Draft it**.
3. Set **When** (the trigger, for example "a deal is won"), **Only if** (optional conditions) and **Then** (up to 10 actions in order).
4. Turn on **Enabled** and save.

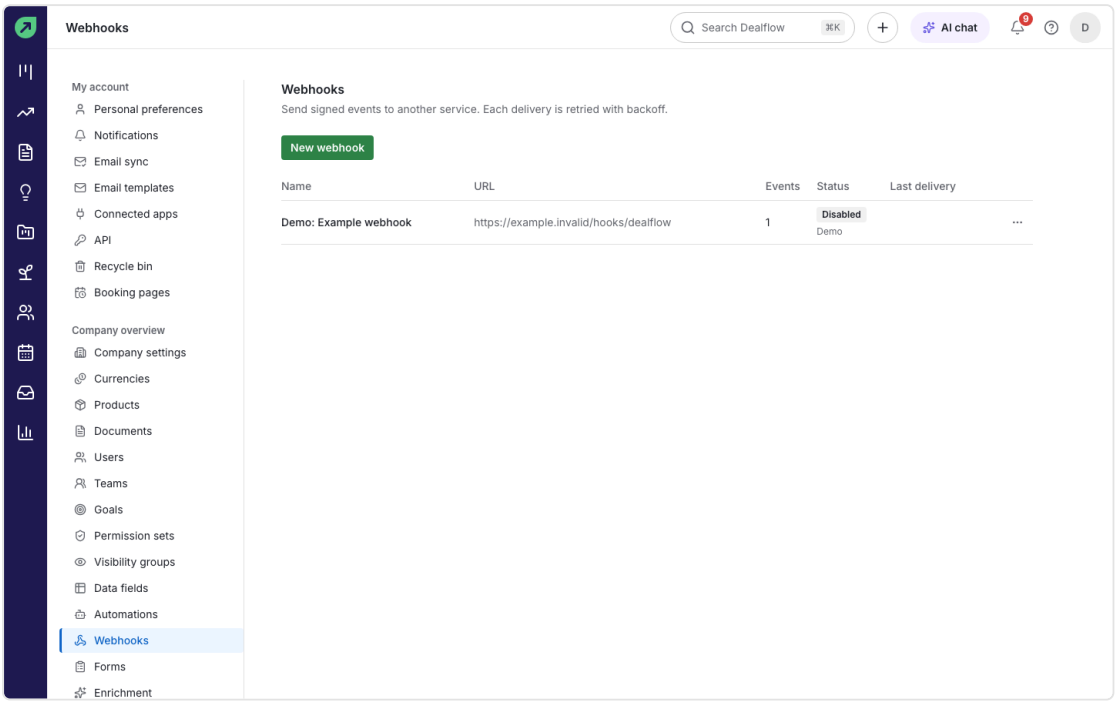

Actions available: update the deal, create an activity, add a note, notify a user, send a saved email template, and the AI steps: summarise the deal, score the deal and draft an email. Text fields can use variables such as `{{deal.title}}` and `{{person.first_name}}`.

Tips:

- The **Run log** tab shows every run and why any run failed or was skipped.
- Dealflow stops automations from triggering each other in an endless loop.

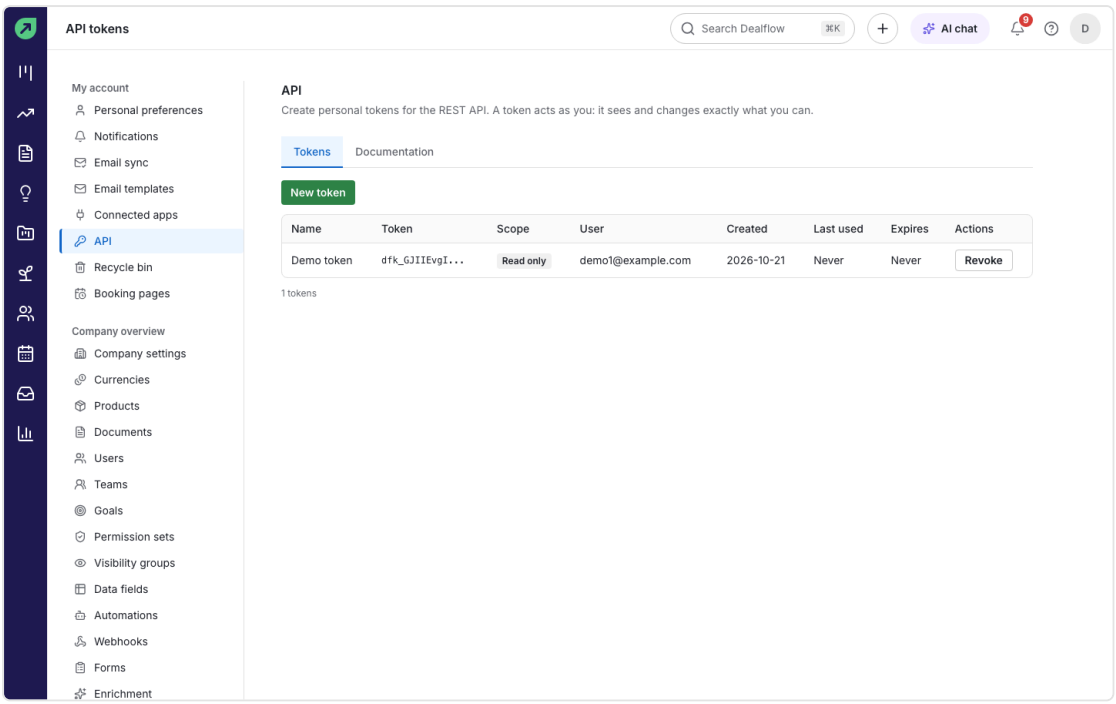

How to send events to another system (webhooks)

1. Go to **Settings › Webhooks** and select **New webhook**.
2. Enter a **Name** and the **URL** to send to, and tick the **Events** you want (for example `deal.won`, `person.created`, `invoice.paid`, `form.submitted`).
3. Select **Create**.

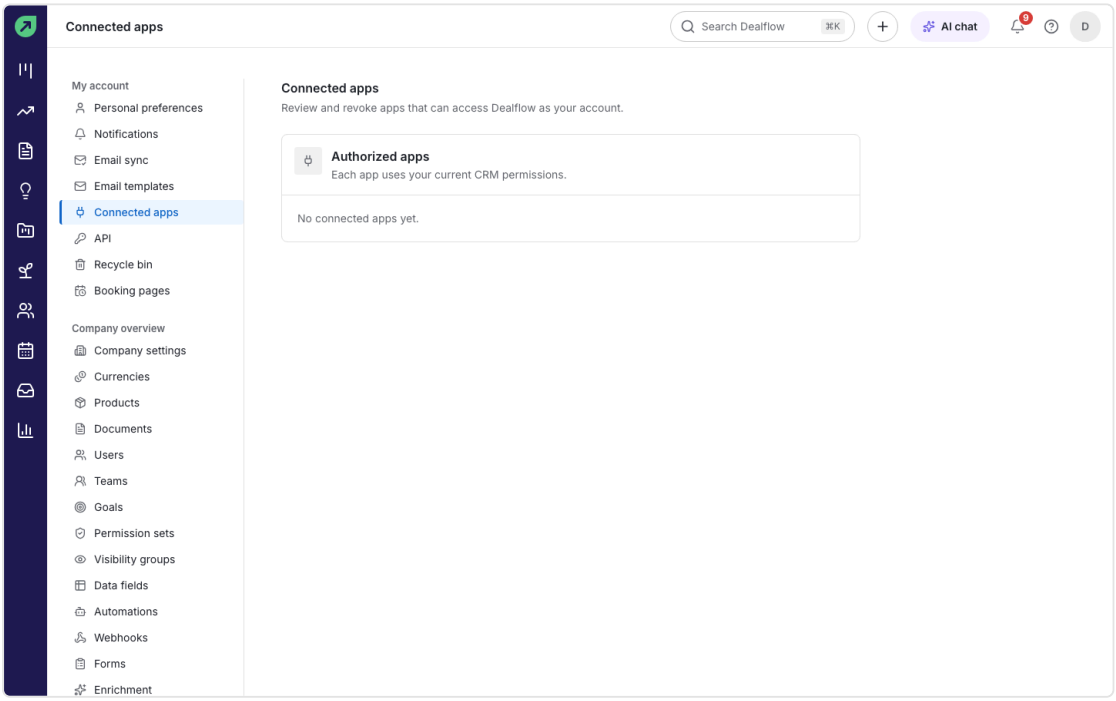

Result: each event is sent as a signed request to that URL. Failed deliveries are retried several times over a few hours. After ten deliveries in a row fail, the webhook is disabled and you are told. Use the webhook's **Delivery log** to see what was sent.

How to give another tool API access

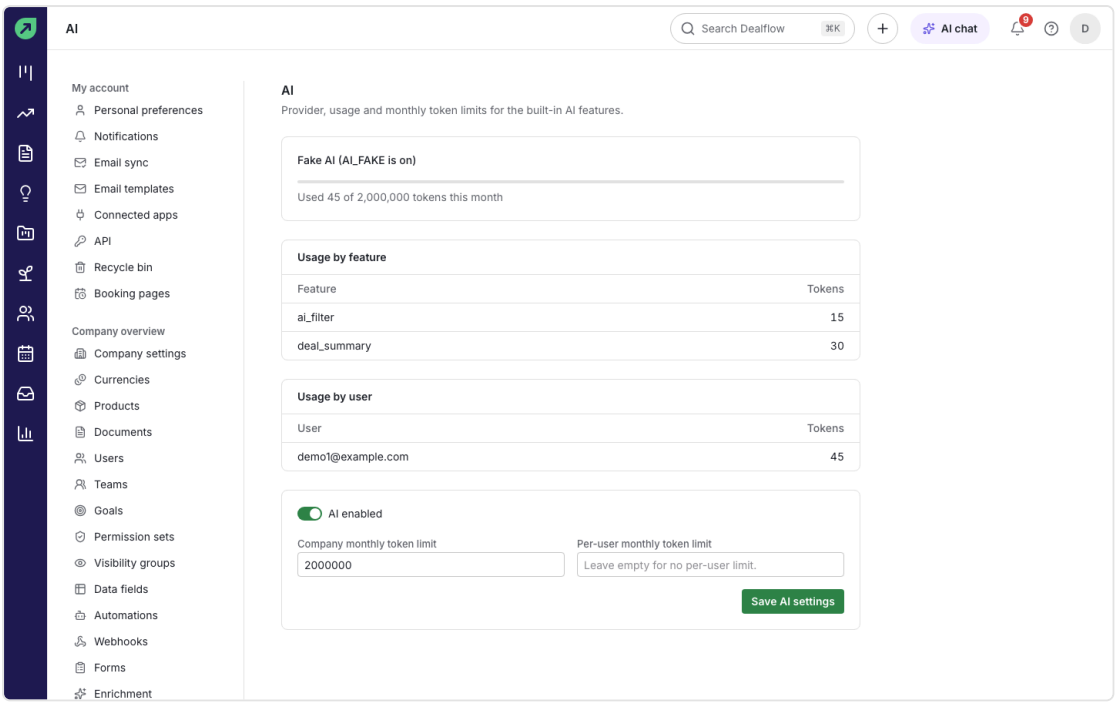

1. Go to **Settings › API** (each user can do this for themselves).
2. Enter a **Name**, choose the **Scope** (read only, or **Read and write**) and select **Create token**.
3. Copy the token now. It is shown once.

Result: the token works with the Dealflow REST API and sees exactly what you can see. The **Documentation** tab describes every endpoint. **Revoke** a token to stop it working.

Connected apps: AI tools that connect to Dealflow (through its MCP server) appear in **Settings › Connected apps**, where you can revoke them.

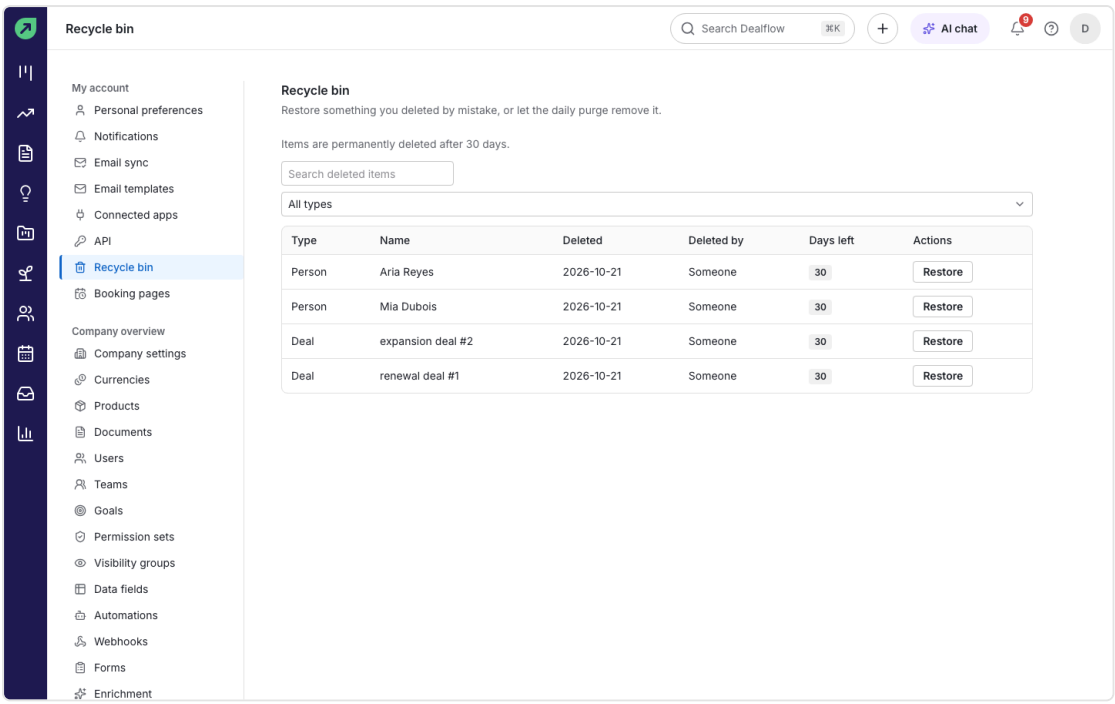

How to manage AI

1. Go to **Settings › AI**.
2. See which AI provider and model are in use, and how many tokens have been used this month, by feature and by user.
3. Turn AI on or off for the company, and set the **Company monthly token limit** and an optional **Per-user monthly token limit**.
4. Select **Save AI settings**.

Result: when a limit is reached, AI features stop until the next month and users see a message saying so.

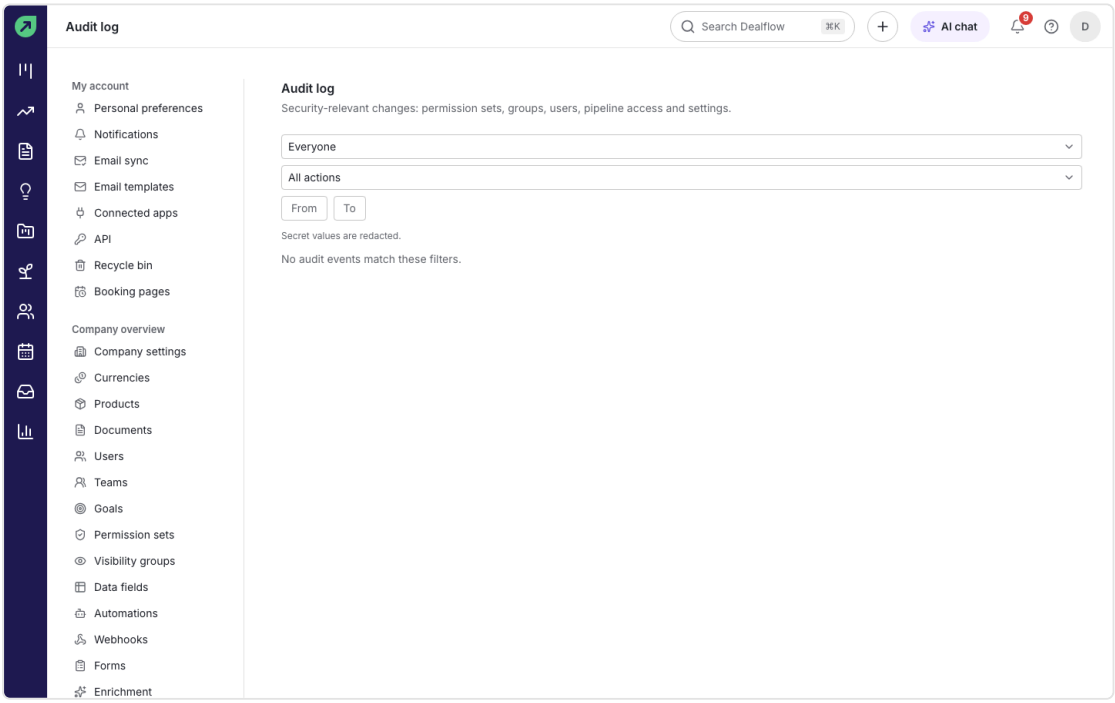

How to restore something deleted

1. Go to **Settings › Recycle bin**.
2. Find the item (filter by type or search) and select **Restore**.

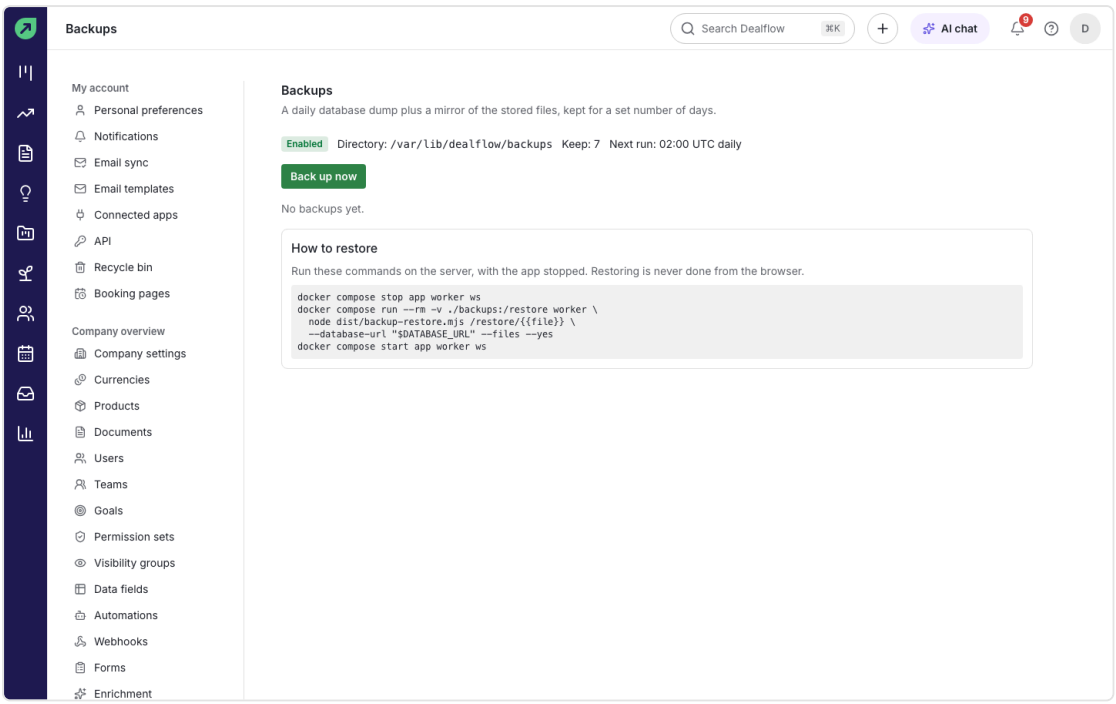

Result: the record is back where it was. Items are permanently deleted after 30 days; **Days left** shows how long each one has.

How to review security changes

Go to **Settings › Audit log** to see who changed permission sets, groups, users, pipeline access and settings, and when. Filter by person, action and date. Secret values are never shown.

How to check backups

1. Go to **Settings › Backups**.
2. Check the status, the folder, how many days are kept and the next run time (daily at 02:00 UTC by default).
3. Select **Back up now** for an extra backup, for example before a big import.

Restoring is done on the server, never from the browser. The page lists the exact commands; see also Self-hosting.

Other settings

- **Import data:** see Contacts and organizations.
- **Products** and **Documents:** see Quotes and invoices.
- **Forms** and **Booking pages:** see Forms and booking pages.
- **Goals:** see Stats and reporting.
- **Enrichment (optional):** connect Apollo, RocketReach or GetProspect with your own API key in **Settings › Enrichment** to let users fill in missing contact details. Each provider stays off until you add its key.

Self-hosting and install

This page is for the person who runs the Dealflow server. Dealflow is self-hosted and single-company: one install serves one company, and your data stays on your own machine.

The full technical references are `docs/deploy.md` and `docs/reverse-proxy.md` in the repository. This page is the short version.

What you need

- A Linux server with Docker and the Docker Compose plugin.
- A domain for the app (for example `crm.example.com`) and a second one for file storage (for example `s3.crm.example.com`), both pointing at the server.
- A reverse proxy that handles HTTPS (for example Caddy or nginx). Dealflow does not include one.
- An SMTP account for the emails Dealflow sends (sign-in links, invites, notifications, quotes). Campaigns can use the same account or a separate bulk provider (see Campaign email).
- Optionally, an OpenRouter API key for the AI features.

What runs

Service	What it does
`app`	The Dealflow web app
`ws`	Live updates in the browser
`worker`	Background jobs: mail sync, scheduled email, automations, reminders, backups
`postgres`	The database
`minio`	File storage (attachments, imports, photos)
`migrate`	Runs once on each start to update the database

How to install

1. Get the code onto the server and copy the example settings:

```
cp .env.example .env
```

2. Fill in `.env`. The values that matter most:

Setting	What to put
`BASE_URL`	Your app address, for example `https://crm.example.com`
`NEXT_PUBLIC_WS_URL`	`wss://crm.example.com/_ws`
`MINIO_ENDPOINT`	Your storage address, for example `https://s3.crm.example.com`
`SEED_ADMIN_EMAIL`	The email of the first admin
`SMTP_HOST`, `SMTP_PORT`, `SMTP_SECURE`, `SMTP_USER`, `SMTP_PASS`, `SMTP_FROM`	Your outgoing mail account
`OPENROUTER_API_KEY`, `OPENROUTER_MODEL`	Your AI key and model (leave the key empty to run without AI)
`BASE_CURRENCY`	Your company currency, for example `GBP`

3. Generate the secrets:

```
openssl rand -base64 32   # TOKEN_ENCRYPTION_KEY
openssl rand -hex 32      # WS_TICKET_SECRET
openssl rand -hex 16      # MINIO_ACCESS_KEY and MINIO_SECRET_KEY
```

4. Start everything:

```
docker compose up -d --build
```

5. Point your reverse proxy at the three routes below, then check the app is healthy:

```
curl -fsS https://crm.example.com/api/health
```

Result: `{"ok":true}`.

Campaign email

Campaigns send through a separate account so a large marketing send does not share the reputation of your sign-in and notification mail. Leave `MARKETING_SMTP_HOST` empty to fall back to the `SMTP_*` account above.

Setting	What to put
`MARKETING_SMTP_HOST`, `MARKETING_SMTP_PORT`, `MARKETING_SMTP_SECURE`, `MARKETING_SMTP_USER`, `MARKETING_SMTP_PASS`	Your bulk sending account. Port 465 with `MARKETING_SMTP_SECURE=true` is the common choice.
`CAMPAIGN_SEND_RATE_PER_MINUTE`	The hard ceiling on messages per minute. The team can lower it in **Settings › Campaigns**, never raise it above this value.
`CAMPAIGN_BATCH_SIZE`	How many recipients one worker tick takes. 50 is the default; lower it if your provider is strict.
`CAMPAIGN_DOI_DAILY_LIMIT`	The install-wide cap on double opt-in emails per UTC day. 500 is the default.
`CAMPAIGN_DKIM_DOMAIN`, `CAMPAIGN_DKIM_SELECTOR`, `CAMPAIGN_DKIM_PRIVATE_KEY` or `CAMPAIGN_DKIM_PRIVATE_KEY_FILE`	Optional DKIM signing. Set the domain, the selector and one key field. Signing turns on only when all of them are present.
`CAMPAIGN_BOUNCE_IMAP_HOST`, `CAMPAIGN_BOUNCE_IMAP_PORT`, `CAMPAIGN_BOUNCE_IMAP_USER`, `CAMPAIGN_BOUNCE_IMAP_PASS`	Optional bounce mailbox. Set all four to collect asynchronous bounces and complaints; leave them empty to disable the job. Port 993 is the secure default.

The **From name**, **From email**, postal address and the consent defaults are set by an admin in **Settings › Campaigns**, not in `.env`. The first sender still has to open its verification email before the account can send.

Deliverability checklist

1. Use a sending domain (or subdomain) you control. Do not send campaigns from a free mailbox.
2. Publish SPF for the sending provider, DKIM for the selector in `CAMPAIGN_DKIM_SELECTOR`, and a DMARC record. Start DMARC with `p=none`, read the reports, then move to `p=quarantine` and `p=reject` once the legitimate sources are aligned.
3. Sign in to your bulk provider and verify the domain there too. The provider's own DKIM and SPF records must be present even when Dealflow signs the message.
4. Put the provider credentials in `MARKETING_SMTP_*`, restart the stack, then use **Settings › Campaigns › Domain check** to confirm what public DNS returns.
5. Warm up slowly: send to your most engaged contacts first, keep `CAMPAIGN_SEND_RATE_PER_MINUTE` low, and increase it over several days. A new domain that starts with a large list is the fastest way to land in spam.
6. Configure the bounce mailbox. It catches bounces that arrive after the send, marks hard-bounced addresses as suppressed and keeps the list clean.
7. Keep the postal address and the unsubscribe link in every campaign. They are required, and the one-click unsubscribe header depends on them.
8. After changing any of these values, run `docker compose up -d` so the app and worker pick them up.

For the team's day-to-day instructions, see Campaigns.

Reverse proxy routes

Public address	Send to	Notes
`https://crm.example.com`	`127.0.0.1:3000`	The app, including `/api/*`
`https://crm.example.com/_ws`	`127.0.0.1:8080`	Live updates (WebSocket). Forward the path and query unchanged.
`https://s3.crm.example.com`	`127.0.0.1:9000`	File uploads and downloads. Must match `MINIO_ENDPOINT` exactly.

Keep the app, ws and storage ports bound to `127.0.0.1` so only your proxy can reach them. A working Caddy example is in `docs/reverse-proxy.md`.

How to sign in the first time

1. Go to your app address, choose **Email link**, and enter the `SEED_ADMIN_EMAIL` address.
2. Open the link in the email and set a password.

If email is not working yet, create a one-time admin link on the server instead:

```
docker compose exec app node dist/bootstrap-link.mjs
```

Then invite everyone else from **Settings › Users** (see Admin).

How to update

```
git pull
docker compose up -d --build
```

Database changes are applied automatically before the app restarts.

Backups and restore

Dealflow makes a daily backup of the database and a copy of stored files, kept for a set number of days. Settings: `BACKUP_ENABLED`, `BACKUP_DIR` and `BACKUP_KEEP`. Admins can see the status and run an extra backup in **Settings › Backups**.

To restore, on the server, with the app stopped:

```
docker compose stop app worker ws
docker compose run --rm -v ./backups:/restore worker \
  node dist/backup-restore.mjs /restore/{backup file name}.tar.gz --files --yes
docker compose start app worker ws
```

Without `--files` only the database is restored. Copy the backup folder somewhere off the server too, so a disk failure cannot take both.

Logs

```
docker compose logs -f app      # or ws, worker
```

Privacy defaults

Usage telemetry and the update check are off by default (`DISABLE_TELEMETRY=true`, `DISABLE_UPDATE_CHECK=true`). Nothing is sent anywhere unless you turn it on, apart from the services you configure: your mail server, your AI provider, and any enrichment provider an admin enables.

Troubleshooting and FAQ

Signing in

My sign-in link does not work. Links expire after 15 minutes and work once. Request a new one from the **Email link** tab.

I did not get the sign-in email. Check your spam folder. The sign-in page shows the same message whether or not your address has an account, so also check you typed the address your admin invited. If it still does not arrive, ask your admin to check the server's email settings.

I forgot my password. Sign in with an email link, then set a new password in **Settings › Personal preferences**.

My invite link has expired. Ask an admin to invite you again from **Settings › Users**.

Email

Test and connect fails. Most failures are a mistyped app password, or using your normal mail password instead of an app password. Create a new app password with your mail provider and try again. For **Other IMAP/SMTP server**, check the server names and ports with your provider.

An email is not linked to the right deal. Open the conversation and use **Link to existing** in the right-hand panel. Conversations that are not linked to anyone appear under **Unmatched**.

A scheduled email has not gone out. Look in **Outbox**. Scheduled emails wait there until their send time.

Images in an email are missing. Dealflow hides images from outside senders until you select **Show remote content**.

Deals and data

I cannot see a deal a colleague can see. What you can see depends on your visibility group and permission set. Ask your admin.

A deal disappeared from the board. It may have been won, lost or archived. Check the list view with a filter for won or lost deals, or **Archived deals**. If it was deleted, it is in **Settings › Recycle bin** for 30 days.

I deleted something by mistake. Select **Undo** in the message that appears straight away, or restore it from **Settings › Recycle bin** within 30 days.

Totals in another currency look wrong. Totals are converted to your company's base currency using the rates in **Settings › Currencies**. Ask your admin to update them.

My CSV import went wrong. Select **Undo** next to the import in **Settings › Import data** to remove the records it created, fix the file and import again.

AI

The AI buttons do nothing or show a limit message. Your company or your own monthly AI limit may have been reached, or an admin may have turned AI off. Ask your admin to check **Settings › AI**.

The AI got something wrong. AI suggestions are drafts. Check them before you send or save. The assistant never changes data until you select **Confirm**.

Quotes and invoices

My customer cannot accept a quote. The quote may have passed its **Valid until** date. Duplicate it and send the new one.

I sent an invoice by mistake. Open it and select **Void**. Issued invoices are never deleted, so the numbering stays complete.

General

Is my data shared with anyone? Dealflow runs on your company's own server. Data leaves it only for the services your admin sets up: your mail server, the AI provider (for AI features), and any enrichment provider.

Where is the full list of keyboard shortcuts? Press `?` anywhere outside a text box.

Who do I ask for help? Your Dealflow admin. Admins can find the technical guides in the `docs` folder of the Dealflow repository.
